YOUR COMPUTER Contents

NOVEMBER 1985

Spectrum review: page 52.

Adventure International: page 56.

Midi magic: page 68.

Tower of antics: page 76.

Goonies competition: page 79.

20 **NEWS:** Secret 64 of Adrain Mole; Smellyvision; Hitsville competition; DK's extra 64 saves Amstrad's 664's bacon.

27 **LETTERS:** Last word in the great Microdrive debate from Katherine Peel; is Sir Keith Joseph all he's cracked up to be; extra terrestrials may be upset.

31 **HARDWARE HITLIST:** Our boys in the backroom benchtest a Spectrum printer interface, DK'tronics' Amstrad lightpen and Arnor's Amstrad sideways Rom.

34 **CHRISTMAS COMPUTER BARGAINS:** Nothing stirring in your house — not even a computer mouse? Lee Paddon catalogues the available hardware for Santa.

37 **SOFTWARE SHORTLIST:** Hewson's Paradroid takes pride of place as the most innovative zapperoony yet; plus Donald Duck, Winter Games, Astroclone, and Adrian Mole.

48 **DISC DRIVE BONANZA:** From the Challenger 3 with integral 128K Ram disc at £300 down to the humble QFS interface for the BBC Micro Model B.

52 **SINCLAIR 128:** A new Sinclair emerges in Spanish exile: keypad, more memory.

54 **SINCLAIR ENIGMA:** 3.5 inch disc drive, colour monitor, 1986 model.

56 **ADVENTURE INTERNATIONAL — HOME OF THE HEROES:** Paul Bond visits Scott Adams' other island in Birmingham and meets the Fantastic Four.

58 **INTERACTIVE ADVENTURES:** Yeah, it's a doddle programming adventures — but getting the characters to talk back? James Hartley enlivens your quest.

63 **QUEST CORNER:** Robin of Sherwood reviewed.

64 **BBC KUNG FU MASTER:** Get your kicks on the 6502 microprocessor.

68 **SOUND SAMPLER SURVEY:** Tony Sacks makes like the poor man's Midge Ure and shows you how to play broken glass without an expensive Fairlight computer.

72 **SPECTRUM BASIC SOUND EXTENSION:** This peps up your sound facility by augmenting Spectrum Basic by a further four commands — by Richard Taylor.

76 **64 TOWER OF ANTICS:** The world of multi-coloured sprite graphics.

78 **HOTSHOTS:** Lots of hints, tips, features and bugs.

78 **HOTSHOTS:** Hints, tips, features and bugs. Hotshots is here to help you. We provide a map to help you rid the village of the plagues — yes, Nightshade.

79 **THE GREAT GOONIES COMPETITION:** Goonybirds permitting, you can win a compact disc player on one of 25 Goonies treasure chests. And Cyndi Lauper on disc.

81 **TRAP 'EM:** The aliens are out to get you again.

82 **ASTEROID ATTACK:** Probably as close as you can get to the arcade original.

86 **COMMODORE 64 DOUBLE-DENSITY BLOCKS:** Keith Suddick shows how to make use of a simple Plot facility without going into bit-map mode.

88 **SPECTRUM DRAWER:** A complex draw program by Paul Rhodes with many advanced facilities usually only found on expensive commercial packages.

92 **AMSTRAD GRAPHICS EXTENSION:** This piece of Andrew Ware gives you 13 extra graphics commands, including an Inverse and CopyChar plus Stipple command.

96 **BBC CHANGER:** Fintan Culwin uses the informal approach to manipulate the colour attributes of a BBC's mode 7 screen.

98 **INTO THE WYCHWOOD:** John Dawson controls a plotter.

102 **TELSOFT:** A reminder of how it's done.

105 **FIRST BYTES:** A bluffer's guide to micros — book-buyers beware; how to use data statements; and more on the alternatives to Basic — Forth language.

107 **RESPONSE FRAME:** Answers to questions.

108 **SOFTWARE FILE:** Free software for most home micros.

114 **COMPETITION RESULTS:** Winners of The Stick.

130 **DATEBASE:** Paul Bond rounds up micro events.

72 Sound
88 Drawer
109 Rotate 'n' Rdy
113 Headless Files

Most home computers.

As you can see, the Amstrad CPC 464 is no ordinary home computer.

For a start, it comes complete with an integral cassette datacorder.

And in addition, you get the choice of either a superb quality green screen or a full colour monitor.

With £100 of free software to get you going all you have to do is plug in and start computing.

The 64k of RAM means you'll have plenty of memory to play with. And there are over 200 Amsoft games, that you can play, many exclusive to Amstrad.

But games are only half the fun on the Amstrad CPC 464. In fact using it can also be quite an education.

The kids can learn spelling and arithmetic with software like Wordhang and Happy Numbers.

Whilst adults will love the way it helps around the house with budgetting and accounts.

Put the 464 to work and it will take care of a number of business-like functions, such as wordprocessing and spreadsheet.

AVAILABLE AT BOOTS · BRIDGERS · CLYDESDALE · COMET · CURRYS · DIXONS · GRANADA · GREENS · LASKYS · JOHN LEWIS · RUMBELOWS ·

The complete home computer.

To help you get the most from your CPC 464, there's the Amstrad User Club as well as a number of books and user magazines devoted to this most versatile home computer.

And your 464 will be made even more complete with the simple connection of joysticks, printers, disc drives, speech synthesisers and light pens.

But perhaps the most extraordinary thing about the Amstrad CPC 464 is the price.

Just £199 with green screen, or £299 with full colour monitor.

For more information about the complete home computer, all you have to do is complete the coupon.

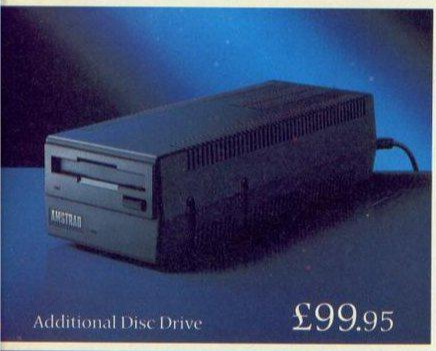
T.V. Modulator for CPC 464 £14.95



Additional Disc Drive £99.95

DMP 2000 Printer £159.95

Amstrad owners start out happy, and get even happier as time goes on.

The first delightful discovery is that both the CPC 6128 and the CPC 464 are complete and ready to use as soon as you get them home.

The CPC 464 comes with built-in datacorder, and the CPC 6128 with built-in disc drive. And both have either a full colour monitor or a green screen.

But Amstrad owners can become even more attached to their computers with the simple addition of the peripherals featured here.

They'll make your Amstrad faster, harder working and more entertaining.

And they're very easy to attach. Simply plug in, and away you go, there's no need for extra interfaces.

You may of course wish to get into some even more serious computing, for which you will need the Amstrad RS 232C specialist interface. This opens the door to modems, networks, and serial printing.

But whichever additions to your Amstrad you care to make you'll find their low prices an additional pleasure.

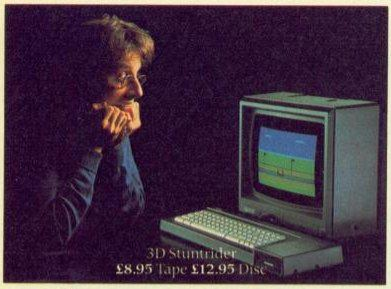
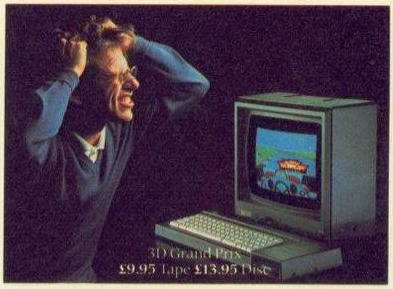
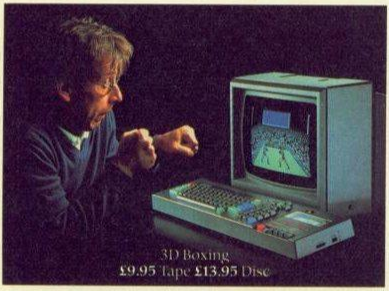
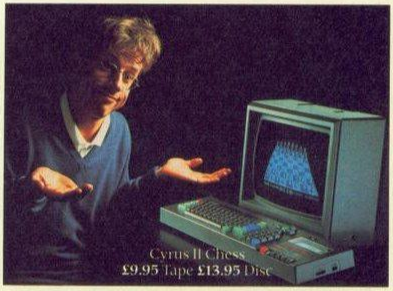
THE COUNTDOWN HAS BEGUN
CRITICAL MASS
From DURELL
Commodore 64
Spectrum
R.R.P. £8.95
DURELL sales dept.,





When it comes to computer games you can't beat an Amstrad.





We've enlisted the help of some particularly wicked program designers to put our entertainment software range together.

They've come up with over 200 Arcade and Adventure games.

Many of them exclusive to Amstrad (like those shown above). All of them mindbenders you'll find hard to beat.

And all at prices that are as competitive as the games, from £12.95 on disc and £8.95 on tape.

But the software is only one of many good reasons for buying an Amstrad computer.

The 64k CPC 464 computer comes complete with built-in datacorder and a choice of green screen or full colour monitor.

The CPC 6128 is a big memory 128k computer with built-in, fast-loading disc drive and again, it's own colour monitor or green screen.

Both are available at an all-inclusive price you'll find hard to match.

In fact, with Amstrad's unbeatable software, unbeatable hardware and unbeatable prices, how can you lose?

The Evil Crown

Feudal England, 1200 AD. In these days you are not elected to anything. What you want, you take. Do unto others before they do it unto you is the motto which you, as Baron, live by. The path to success is an easy one to travel — total self-interest is all that is required. Starve the peasants, amass a personal fortune and overthrow the King. The killing of a few opponents in the jousting tournament can only enhance your notoriety. One more thing you should know — if you try and fail in your quest for the Evil Crown, you will be executed for treason. Fair enough?

The Evil Crown: an icon-driven animated simulation game of power and politics in the middle ages. Easy to play, very difficult to beat!

Retail price £9.99 on both Commodore 64 and Spectrum 48k.

M'LORDS, LADIES, & GENTLEMEN... FRESH FROM AMERICA
U.S. GOLD PROUDLY PRESENTS... THE UNDISPUTED CHAMPION...

From time to time a software title is released, so innovative that it breaks new ground in graphical and technical achievement — Fight Night, the first animated simulation on the C64 is more than a game, more than a simulation — it is a revelation!

"It has class, it has style — forget the rest, Fight Night is quite simply the absolute best." — Tony Takoushi Computer & Video Games/Computer Trade Weekly.

"It's like watching and playing a cartoon computer version of Rocky. Fight Night has pushed the graphical capabilities of the C64 to its utmost limits" — Zzap 64 November.

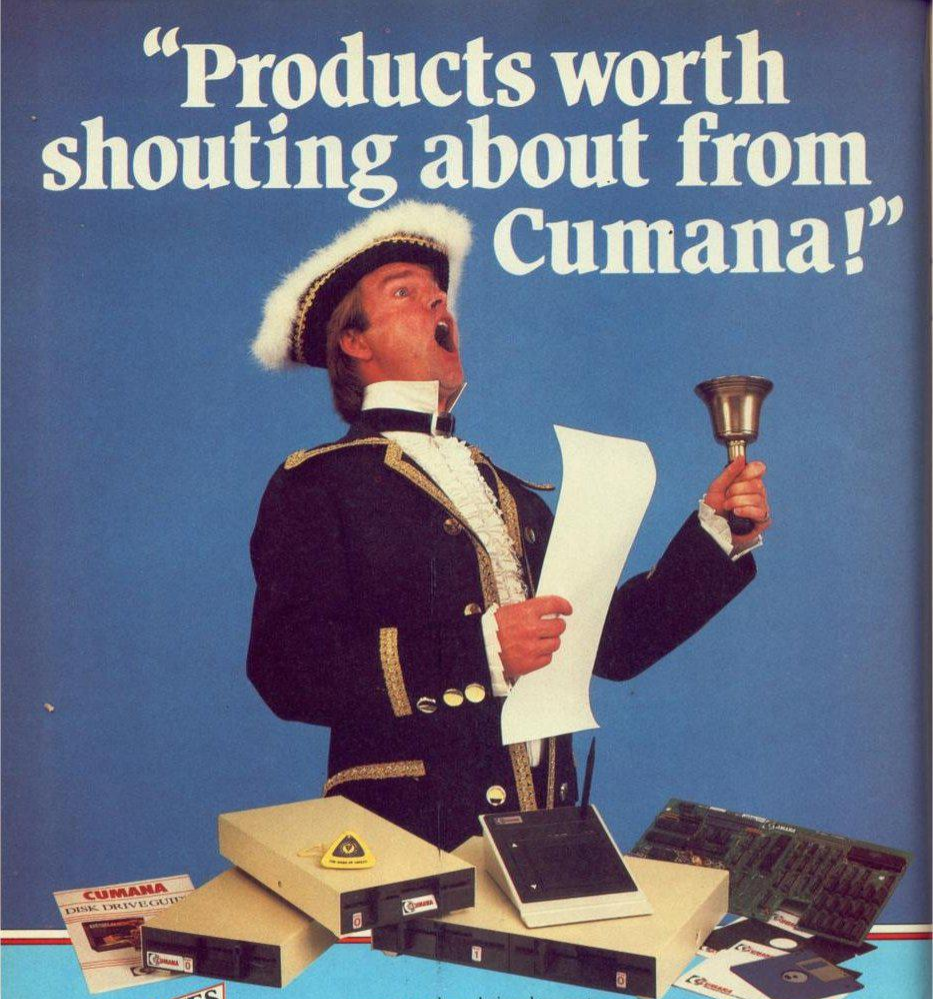
"Products worth shouting about from Cumana!"



DISK DRIVES

Cumana, Europe's leading supplier of floppy disk drives and the only manufacturer to date to win BEAB approval to BS415 for electrical safety, now have an even wider product range than ever before – whether for the BBC, Spectrum, QL, Amstrad, Apple, Enterprise, Dragon, Tandy, Electron, Oric Atmos, Cumana have the best quality drives available.

UPGRADE

But Cumana's range now covers much more than just disk drives; there's a growing range of exciting new computer products designed to uprate and extend the uses of the most popular micros. Products like the Cumana Upgrade – a major expansion to the BBC and QL micros, enabling real-time minicomputer performance with .5Mb of RAM and high level applications software. 10Mb and 20Mb Winchester systems are available for both the QL and BBC using Upgrade.

TOUCH PAD

There's the new, improved Touch Pad graphic input device with powerful Screen Artist software – an infinite variety of graphic design or artistic uses for the home, business or education, taking you another step towards the professional league. Ask us about the new Touch Pad library!

SOFTWARE

Also new and exclusive to Cumana is Pocket Wordstar – a full implementation of Wordstar & Mailmerge, the industry standard word processing package. Thanks to Cumana, it's now available to you, at a price within every users pocket.

Cumana the very best name in memory.

"And so are the prices!"

THE LAMPS ARE GOING OUT...

THE PULL OF profit and prestige sucked Britain's biggest computer manufacturers Sinclair and Acorn into their great American disasters. If only they had looked closer to home. There, right on their dorrsteps waited the huge and largely untapped European markets.

At least Sinclair and Amstrad seem now to have cottoned on. Amstrad's impressive £20 million profit figures owe much to very healthy overseas sales — it's pushing its computers hard in West Germany under the Scheider marque, chosen to appeal to the Teutonic sensibility. Ironically the name Amstrad in this country scores with its overtones of Scandinavian efficiency.

Sinclair on the other hand has gone Spanish. Granting Investronica of Madrid the right to build a 128K machine may prove to be one of the most intelligent moves the company has made since the launch of the Spectrum itself back in 1982. Spain may not be in the same league as the U.K. in terms of computers per capita, but then that's the perfect reason for going there. Potentially it also opens up the vast Spanish-speaking South American market.

The Spaniards have already proved their skills in the car-building business: they took on contracts from major automotive manufacturers to build cars under licence. Now they are among the biggest car builders in Europe and are selling their own models into other countries.

Even British products written off as failures in the U.K. have been eagerly scooped up by other Europeans. Now alongside the Camembert factories you'll find Orics being churned out in Normandy, or Dragons being bred in Spain by Eurohard.

Two years ago Britain was a long way ahead in terms of volume and sheer variety of computers. If more energy had been spent then in spreading the risks and making a mark in Europe and less on the notoriously volatile U.K. scene, many of the financial disasters of 1985 could have been avoided.

The sun may never set over the British computer Empire, but that's because it never rose in the first place. If companies are to survive it must be on a broader footing. Europe may be the last chance they get.

"Take that. Fion the Magic Cirle."

BATTLE OF WIZARDS

BRITAIN'S WIZARDS are locked in battle over who shall control the market for micro magic. One man, David Hambly from Knights Way (yes seriously) Ilford is taking on the whole power of the Magic Circle. The Magic Circle is releasing a book and tape which will allow you to perform 15 different tricks on your Spectrum, Commodore or Amstrad. "When you learn from this book and software the secrets of magic, remember that you must keep them to yourself." says John Salisse, Secretary of the Circle "They are not yours to give away". But despite John's claims that the Circle suite is unique David Hambly can show micro magin books and software that he has produced over the years. Contact Sardi's Software (01) 551-5908 for details.

Future plot

FLAT BED plotters are no longer the play things of the idle rich.

Future Music is selling Roland DXY100 A3 sized plotters at the remarkable price of £259. The plotter is connected to the computer via the centronics port, so, theoretically could be used with most home micros. However, the company only supplies software for the BBC. Supplied with the plotter is a ROM as well as some examples of 3D plots on cassette. The ROM routines include music and graph plotting, arcs and hatching. Resolution is to .1mm with a plotting speed of 70mm/s. You can find out further details from Future Music on (0245) 352490.

AMSTRAD BOOM

664 problems solved

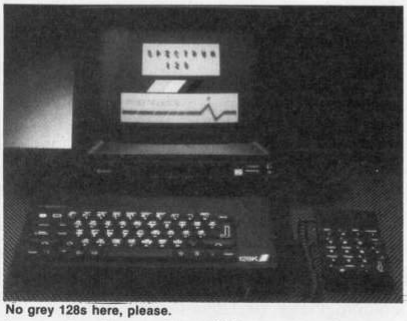
AMSTRAD CONTINUES to confound the prophets of doom in the micro industry by announcing record turnover and profits up to £20 million compared to Commodore's announcement that it is losing $1 million a day and Acorn and Sinclair's dismal results. What is more Amstrad's boom is based almost entirely on computer sales. When the British market started to flag Amstrad just sold them abroad instead.

The PCW 8256 all-in-one word processing package is selling briskly. Unfortunately companies like Dixons had neglected to stock up with the 3 inch discs it uses, leading to shortages in many areas.

Another problem for Amstrad 664 owners who found themselves ditched by the rapid introduction of the 6128 has been solved by DK'tronics. DK will sell an £50 64K extra memory unit for the 664 which will work with switching and system calls but not from Basic since the 664 Rom has not been overlaid. DK will also introduce a 256K expansion pack for £100 — the same price as a 16K expansion for the ZX-81 four software which uses bank years ago. A 256K silicon disc is also on the way.

PCW 8256 sells too fast for Dixons.

SECRET DIARY OF SIR CLIVE, AGED 45¼



No grey 128s here, please.

SINCLAIR SAYS Spectrum Plus and QL sales are booming — selling at twice the rate of Commodore and Acorn put together.

But Commodore is now fighting back hard with an Adrian Mole promotion for the 64, delivery at long last, of the 128 and announcement of the Amiga's official launch in January.

Behind the scenes neither company is having an easy time with Commodore announcing $124 million losses for March, April and May while Sinclair is moving out of its prestige headquarters in Willis Road, Cambridge, sacking 20 of its 120 employees and losing the likes of Robb Wilmot and Nigel Searle.

Rumours that the Spanish Investronica-built Spectrum 128 would be unofficially imported to Britain have been quashed. The only "grey imports" will be to software houses preparing products for the British launch next February. Commodore's Christmas promotion meanwhile will bundle a 64, cassette recorder, Music Maker, Designer's Pencil and the book and game of The Secret Diary of Adrian Mole.

The Commodore 128 is now on sale as a standalone but because the cost of the original 128 including 1571 double-sided drive looked prohibitive it will now be bundled with the 1570 single-sided 0.5 Mbyte drive for $450.

DIARY

WHICH COMPUTER is "the BMW of the home computer business" and who called it that?

HERE'S A CLUE for the BMW question. the designer of one of the chips inside it "Dave" also designed the three-wheeler which won the Euromouse 1985 micromouse merge race in Brussels last month.

SMELLYVISION will hit your screens on October 20.Brother, the computer printer makers, are launching a scratch and sniff TV promotions for their high speed cookers. The idea is that you will pick up copies of TV Times impregnated with the smell of roast beef, pies and bread. If you live in the Granada or TVS areas and see a Borther commercial starting the idear is that you will race to your paper rack and then wait for a "scratch now" caption to appear as the oven door is opened. That could be fun with computer games, we could have scratch 'n sniff pads in *Your Computer*. A prize for the best suggestion.

BRITISH TELECOM is enjoying what it is learning from the home computer market. The little birds, which we diarists use in preference to those nasty leaky phones, tell us that Firebird tasted so nice that BT is buying Beyond as well.

STEVE JOBS, who gets the credit as co-founder of Apple with Steve Wozniak for starting the home computer revolution, has left the company on acrimonious terms. Apple is suing Jobs for stealing information and employees now that he has left to set up a company making educational computers.

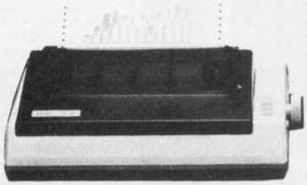
MEANWHILE that once-mighty school micro maker Acorn has turned out to be a participant in the "Euro-rival to MSX" project. Olivetti is of course involved but the third participant is not Philips as expected, but Thomson which dominates educational computing in France.

BMW Enterprise of course. Who said it? Enterprise's Mike Shirley. Dave Woodfield, who designed the chips and the mouse works for Intelligent Software.

Elsie Dee

OPEN SUNDAYS 10 - 1

more unbeatable deals from Data star Systems!



THE *INCREDIBLE* NEW STAR SG-10 NEAR LETTER QUALITY PRINTER.

Star SG-10 £259 + VAT	£297.85
Parallel cable for any Micro (max. price)	£20
2 Spare ink ribbons	£5
2000 sheets of continuous listing paper	£15
Next day doorstep delivery service	£10
	£347.85

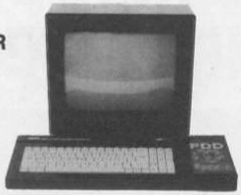
Datastar's all in price £297.85!!!

Just a few of the many features:—

- Easily switchable between Epson & IBM graphic/print models.
- Will print all ASCII codes from computers that can only send 7 bits on their parallel interface such as Amstrad CPC 464/664 and Apple II.
- Compatible with all word processing programs.
- 50 CPS NLQ mode available from switch on.
- 120 CPS draft mode.
- 2K print buffer — expandable to 10K

AMAZING AMSTRAD WORD PROCESSING OFFER ONLY FROM DataStar Systems

Amstrad CPC 6128 green screen computer	£299.00
Tasword/Mailmerge W/P package	£24.95
Star SG-10 printer package as above	£347.85
Next day doorstep delivery service	£20.00
Total value:	£691.80



DataStar's Superdeal Price £619.95!!!

Many more package deals available on other Amstrad models and makes of micro's.

All goods despatched FREE OF CHARGE by next day doorstep courier service

UPDATE

Better late than never, but sometimes it's difficult to tell the difference. Digital Integration, who rocketed to obscurity after over-night success, look like finally releasing *Tomahawk*, a helicopter simulator after keeping the punters wating for over a year.

Despite this, they might be forgiven if it turns out to be as wonderful as they say it is. Air combat, vector graphics, ground targets, lots of instruments, it may well have the same impact as Fighter Pilot did when it came out in what silicon archaeologists like to call the early durasic period.

Novagen still insists **Mercenery** is on the way, leaving the answer phone to cope with the calls of anxious punters. Novagen assures us the delay is simply due to wanting to make it even better!

Spectrum Elite nears completion. Unfortunately, Firebird have had to leave out most of the missions that other, less scrupulous magazines reported were in their "review copy" due to memory restraints. However, it still promises to be wonderful. Apparently Firebird's Gyron team has virtually re written the structure so that it won't slow down when a lot is happening. A new launch sequence and revamped display is promised.

Activision has forsaken the humdrum world of the shoot-em-up, for the philanthropic pursuits. Apparently, they discovered the presence of **Little Computer People**, and unlike you or I, would simply have given the thing a voilent shake and hoped the little debugger would fall out, Activision, gave it a house, coaxed him out of the innards and on to the screen. Of course, they are all different, Activision just give you the house, and the little chap takes on his own individual character. Not only that, **Hacker** is an attempt to spare NASA's blushes, and many parent's phone bills by diverting code breakers from the real thing to a game with the highly laudable task of saving the world.

ARIOLLAMA

Minter joins Zombies

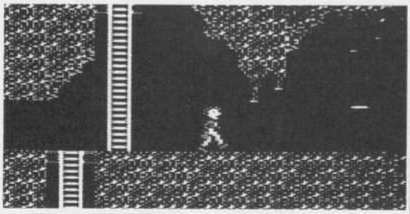
MINTER IS back with a vengeance — the label may have changed but the psychotropic dreamer maintains his firm commitment to fast-scrolling all-action shoot-'em-ups that leave the player with much deeper comprehension of the traumas of shell-shock. Batalyx — not so much released as allowed to escape — from Ariolasoft is obviously Jeff's compilation album, sitting well on his shelves next to the Pink Floyd Relics cassette, no doubt.

Six games for £12.95 on Commodore 64 disc, £9.95 on cassette: kick off with Hallucin-O-Bomblets, a freaky asteroid derivative; then AMC II, a dub version of Attack of the Mutant Camels; next, the very abstract Activation of Iridis Base. This gives you a driver's-eye-view of a mutant camel approaching a pyramid. When the base is activated a — you guessed it — Dark Side Of The Moon album cover effect is generated. The Ancipital returns in Cippy on the Run, followed by a geometric puzzle called Syncro II. Finally a re-run of Psychedelia. Review next month.

Recognisable Jeff Minter.

Scarabeus sees Ariolasoft's phalanx of Hungarian programmers producing good graphics, great sound and an absorbing arcade adventure. Aim of the game: find the fabulous Emerald jewel of the Pharaohs by zooming aroud a 3D maze in Scrollerama. On each of the three levels you must assemble or find a key to get to the next level by capturing ghosts or entering places of information. Zombies and spiders conspire to prevent you getting into the Pharaoh's tomb. This ranks with Ariolasoft's Skyfox as an attempt to market good original material, rather than the older US games. Wizard, the third release, includes a screen construction set, so if you get tired of jumping the climbing through 40 dazzling screens as you reach for diamonds, gold and pearls, you can change the game. Both Wizard and Scarabeus are £12.95 on C-64 disc, and £9.95 cassette.

DOCTOR WHO AND THE MICRO ROMS



"The Daleks are off but can I recommend the TARDIS".

ROM chips have got cheaper — some EPROMs are reportedly available for a quarter of their January price — which has literally created ROM to move for claustrophobic programmers sweating away trying to produce epics in 32 or 48K of memory. At least two software houses are using sideways ROMs to expand the memory of a specific computer so it can run a specific games program. Means you have to dig a little deeper into the piggy-bank, but they claim it's worth your while. At £14.95, Mikro-Plus (alias Mikro-Gen) are confident that Shadow of the Unicorn is value for money. Not only do you get 64K of program on you Spectrum and a 120-page illustrated book, but you also get a built-in joystick port, and back-up to microdrive or tape facility, plus a diagnostic checking and tape alignment routine for trouble-free loading.

Shadow of the Unicorn is the tale of an unwitting farmer who opening an old tomb he has discovered releases evil forces. There are 10 fully-animated characters all with their own part to play in helping you to reseal the book. There are 2,800 locations and 11,500 views according to Mikro-Gen's Tony Bentley. "It's a very deep and complex adventure — it will definitely appeal to people who like Valhalla or Lords of Midnight."

Dr Who and the Mines of Terror is Micro-Power's foray into the land of the sideways ROM. For your £18.95, you get another 16K of memory (19.95 for disc version) and very large platform game. The aim of the game is to recapture the plans of the TARDIS time machine and destroy the Master's factory. Based on the popular sci-fi TV series, it lacks Daleks, but has plenty of problem-solving.

Mikro-Gen see a future for ROM: two more expanded games are under development. Battle of the Planets, licensed from BBC TV, and the ultimate Wally game, Wally in Paradise.

GREAT GRAPHICS. NO GIMMICKS.

SPRITE MACHINE. The latest from Print'n' Plotter. The simplest sprite program to use. Available November. Send for details now.

ART-O-MATIC. New from Print'n'Plotter. If you want the ultimate in memory saving *and* fantastic graphics, you need ART-O-MATIC. Fully documented instruction book. Available November.

PAINT PLUS. Every facility to produce great screen graphics to use in your own BASIC or M/C programs. No gimmicks. 100 page instruction book.

SCREEN MACHINE. The graphics manipulator. Instant machine code techniques to improve graphics and save memory, including text compiler. 100 page instruction book.

For years we have been leading the way while others have tried to follow. If you know anything at all about the graphics programs for the ZX Spectrum, you'll certainly already know about PAINTPLUS and SCREEN MACHINE. These two programs have helped thousands of frustrated graphics programmers become computer artists practically overnight.

Now, we are introducing two new programs that will make your graphics even more professional: ART-O-MATIC and SPRITE MACHINE.

ART-O-MATIC is for the programmer who wants superb graphics but insists on the minimum of memory consumption. It's a graphic compiler with facilities to produce all the graphics *and* compile, disassemble, relocate, insert, delete, and save to use in your own programs. If you write complex games like adventures, or if you want to cram hundreds of graphics into a program, this is the program for you.

SPRITE MACHINE is the most exciting graphics program for years. Now *you* can program fast moving graphics simply, easily and professionally. Everything you produce can be located in your own programs (not like some "games" programs), and the facilities are enormous.

Sprite shape and form, motion pattern, speed, colour, trace, collision detection, animation, animation speed, four variations of edge action and animation windows — this is only part of what's available.

Post to Dept YC, Print'n'Plotter Products Ltd., 19 Borough High Street, London SE1 9SE or phone 01-403 3622 with your credit card order.

Print'n'Plotter Products

ROMANTIC ROBOT present

multiface one™

Nº1 Spectrum multipurpose interface with

1) Fully automatic and universal 100% push-button back-up of any program to cartridge, disks, wafer, tape
2) Joystick interface 3) Composite video interface

All three in one compact box at an amazing price of £39.95!

- Menu-driven with prompts & one-touch commands turning a complex task into a trivial procedure: 1) Push button 2) Select function - exit/return/save/change syntax 3) Input name 4) Select destination - tape/cartridge/wafer/disk
- Automatic, intelligent "compressed" saving for fast re-loading & economizing on space on cartridges, disks etc. MULTIFACE saves only the relevant parts of RAM and leaves out the rest.
- SAVE to any type of peripheral - default syntax for MICRODRIVE, WAFADRIVE & TAPE can be changed for disk systems etc. Transfer from one peripheral to another if both attached at the same time, or save from one to tape, swap, reload & save to the other one
- Can be used not only for pure back-ups: you can, eg.: stop any program and restart anytime later or also study/alter/customize and then save, continue, etc. This way you can load and continue a game from where you got last, poke infinite lives, customize programs "warm reset" - recover from a "crashed" computer (escape from infinite loops when the keyboard is inoperative, etc.) save just a screen or leave out screen when saving a program
- Designed to remain attached to RUN programs it saved as it is meant only for personal use in accordance with copyright laws
- No extra software - has internal 8K EPROM & 2K RAM
- Through extension bus for connecting other peripherals

Unbeatable value & specifications

TRANS-EXPRESS

The software way of transferring Spectrum software. 4 utilities for m'drive, 2 for wafadrive, 2 for Opus Discovery. Invaluable for cartridge/disk maintenance & automatic transfers. Highly professional, user-friendly, versatile and comprehensive. 'An ingenious piece of software.'

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order advertisements in this magazine and pay by post in advance of delivery, *Your Computer* will consider you for compensation if the Advertiser should become insolvent or bankrupt, provided that:

(1) You have not received the goods or had your money returned; and
(2) You write to the Publisher of of *Your Computer* summarising the situation not earlier than 28 days from the day you sent your order and not later than two months from that day.

Please do not wait until the last moment to inform us. When you write, we will tell you how to make your claims and what evidence of payment is required.

We guarantee to meet claims from readers made in accordance with the above procedure as soon as possible after the Advertiser has been declared bankrupt or insolvent.

This guarantee covers only advance payment sent in direct response to an advertisement in this magazine not, for example, payment made in response to catalogues etc., received as a result of answering such advertisements. Classified advertisements are excluded.

Write to: Your Letters, Your Computer, Room L221, Quadrant House, The Quadrant, Sutton, Surrey SM2 5AS. Our Prestel mailbox number is 019991800.

YOUR letters

Dear Sir Keith,

I would like to paint a small scenario. There you are early one morning eating your third Shredded Wheat. Your complimentary Daily Maxwell lies open on the kitchen table. The teachers pickets outside are still in their tent. Suddenly the peace is broken. A bulky figure plods up the garden path. It is none other than Chief Superintendent Robert Hay coming to feel your collar. Why?

This Conservative government, of which you are quite rightly a senior member, is responsible for many great achievements. The sinkings of the Belgrano and Arthur Scargill perhaps being the best known. Our concern however is two lesser known successes. The micros in schools scheme and the Copyright, Computer Software, Amendment Act 1985. It is the combination of these that will attract the attention of the aforementioned Chief Super.

The micros in schools scheme made two Cambridge based trainee businessmen unfairly rich. It also made our schoolchildren the most computer literate in the world. So far so good. The downside is that it has made our schools hotbeds of criminal activity. The problem is that the scheme has provided plenty of money for hardware and very little for software. Without lots of good software a computer is only useful as a paperweight.

It is not that teachers condone copying software. It is not even that they approve. The fact is that it is the teachers who are doing the copying. On the grand scale. Copying software is theft of intellectual property. Stealing. Just think of the effect on the moral judgment of our schoolchildren when they see that. Here are their elders and supposed betters, their peers in society, to look up to and emulate. Criminals.

These schoolchildren may be the most computer literate but do they know the right things? The fact is that the educational software market is a complete mess. The combination of lack of money and mass copying makes writing software for schools a waste of time. All the talent that could be writing educational software, raising our national educational standards, are writing games. They have to earn a living. Software piracy has led to the formation of the Federation Against Software Theft (FAST). The Federation has lobbied parliament and the result is the new Copyright Act. To enforce the act FAST has employed the gentleman from the scenario, Robert Hay. Anyone he catches copying software is liable to an unlimited fine or up to two years in jail. Surely as Secretary of State for Education there must be a degree of vicarious liability for the actions of your teachers?

Hence the scenario.

The solutions are straightforward. To provide hardware and not software is like providing text books with nothing but blank pages. For every pound spent on hardware at least two pounds must be spent on software. This might result in less hardware but it will definitely produce better educated children. Teachers must be sent directives not to copy software and those that do should be severely disciplined. If only to provide the correct moral example to their charges. The directive must extend to school computer clubs, where school equipment is used to copy the latest games under teacher's supervision.

This country needs a computer literate population to face the future successfully. This is the responsibility of you and your government. The above action is merely a step in exercising that responsibility.

Bruce Everiss

Bruce Everiss.

ALIENATING!

IT IS WITH growing concern that I note the ever-increasing popularity of the so-called "shoot-em-up" type of arcade game.

A craze which started with Space Invaders has now progressed to a cult dedicated to playing far more addictive and complex games. Why, you might ask, am I so concerned about this seemingly harmless pursuit? Well, let me elucidate...

During man's exploration of space, it is inevitable that, sooner or later, he will encounter extraterrestrial civilizations. It is imperative to man's survival that he realises the only way to approach these aliens would be peacefully, preferably followed by a scientific and/or cultural merger.

But when we are instilling into our populace the innate urge to destroy anything alien — through the aforementioned games, — we are simultaneously placing an ominous black cloud over man's very survival. An even more worrying facet of the shoot-em-up cult concerns terrestrial monitoring by alien beings.

We have absolutely no way of knowing whether the Earth is being monitored by a technically-superior civilization, but let's suppose for one moment that it is.

Now, assuming that they haven't gone through a similar "shoot-em-up" phase in their past, and that the very concept of a "game" is incomprehensible to them, then what do you think they will think when they see half the Earth's population squatting over VDUs and zapping pixelized aliens with an apparently insatiable gusto?

My guess is that they would be unlikely to permit the continued existence of the human species. Perhaps we could provide the answer to the problem by persuading computer firms to stop manufacturing these games.

However, I'm realistic enough

(continued on page 29)

VOUCHER OFFER

To get £3 off 'Now Games' and £5 off games like 'Falcon Patrol II', and 'The Biz', just detach the yellow voucher from the cover of this issue.

Keep it, and add it to the voucher you'll find on the cover of the December issue. Here's what your two vouchers will then entitle you to . . .

- Any **one** of the following games, only **£3.99**
- Any **two** of the following games, only **£5.99**
- Any **three** of the following games, only **£7.99**
- **Four** games or more, only **£1.50** for each extra tape

GAMES:

Sinbad — BBC	Terrorist — CBM 64
Jungle Jive — BBC/Electron	Falcon Patrol — CBM 64
Falcon Patrol II — Spectrum	Falcon Patrol II — CBM 64
Strangeloop — Spectrum	Strangeloop — CBM 64
Sorcery — Spectrum	Gates of Dawn — CBM 64
The Biz — Spectrum	Sorcery — CBM 64

Normal prices for BBC/CBM 64 products is **£8.95** except for Jungle Jive and Falcon Patrol **£2.99.** Spectrum product is **£6.95.**
The following games **£2.00** off at **£6.95**, or **£5.95** each if something else purchased:

Now Games — Spectrum/CBM 64
Sorcery — Amstrad/MSX
Ghettoblaster — CBM 64
Hype—the board game about the record business RRP **£19.95** Special offer price **£12.95**

Don't forget to enclose your name and address, vouchers and payment with your order. Cheques or psotal orders payable to Virgin Games, should be sent to:

Virgin Games, Your Computer Special Offer, 2-4 Vernon Yard, Portobello Road, London W11 2DX

This offer closes on January 31, 1986. Remember to wait until you have December's voucher before sending your order.

FOR CONNOISSEURS
OF MODERN LANGUAGE LEARNING

COMMODORE 64 ● BBC (32K) ●ELECTRON ● SPECTRUM (48K) ● AMSTRAD

Access

TELEPHONE ORDERS 24 HOURS
Dealers, contact Lightning, Proteus, or Centresoft.

All titles are immediately available from good computer stores or by 24-hour mail order. Price £8.95 Also available on 40/80 Track disc for BBC. Price £9.95 (overseas orders add £1)

For beginners, O-level and beyond, these best-selling programs are unique and highly successful aids to language learning. Each cassette provides a comprehensive series of vocabulary lessons and a variety of self-paced learning and test modes. All accents and special characters are clearly displayed and different colours denote masculine, feminine and neuter words to reinforce gender learning.
The create command enables new lessons in vocabulary or grammar to be entered, edited as required, then saved on tape. By using this simple yet vital feature, homework lists and exam revision can be retained indefinitely and recalled on demand.
Two cassettes are available for each language, covering thousands of words; Level A provides 16 lessons in general vocabulary; Level B provides a further 16 lessons including adjectives, adverbs and fully conjugated verb lists.

How to write for *Your Computer*

We called this magazine *Your Computer* precisely because we welcome your views, tips and hints and even your criticisms of machines and software in general. Here's how you go about getting your name into print. Your article should be typed, double-spaced, on A4 paper. A name and address on each sheet would help. Don't forget to tell us which machine it runs on. With programs please include a cassette or disc and some indication of how long it is. Please put what machine it's for on the envelope. Don't forget full instructions to us how to load and list your program and how to enter it for the readers.

The article must be submitted exclusively to *Your Computer*. We pay £35 per published page — that's as it appears in the magazine and includes illustrations.

Telsoft

Telsoft is *Your Computer's* software downloading service. Any program for the Spectrum or the BBC — and soon the Commodore — which has a telephone symbol next to it is available on the service. Both 1200 and 300 baud speeds are catered for. For more details call Colchester (0206) 8068. No more lonely nights typing in endless pages of hex digits.

Message service

You can get messages to us in two ways. Either use the Prestel Telex Link to 892084 BISPRES G or you can use our very own modem, day or night on 01-661 8978. The modem is V21, 300 baud, even parity, 10 bits per character. You simply transmit in upper case "YRC" — our address code, and wait for the acceptance code "+++ STF GO". Then off you go. Don't forget to tell us who it's for. Sign off with "NNNN" — again in upper case.

(continued from page 27)

to know that they won't, and hence the reason why I'm writing this letter. I'm pinning my hopes on two things: i). the aliens can read English, and ii). they subscribe to this magazine. If so, and they read this letter, then humanity will be able to breathe a sigh of relief, and once again continue on its weary path to eternity.

Harry Seldon,
Grimsby.

SCREEN DUMP

SCREEN DUMP — YC Software File, August 85 — will be welcome by ZX Spectrum/Interface 1 users as Basic screen dump routines take some 30 minutes to copy a screen. In fact, Brother HR-5 control codes do not fully match Epson ones so a half-height overprinted copy results from the unaltered code.

HR-5 owners need only change one byte at address 32829 from 04 to 08 hex to correct the routine for this popular printer.

A. J. Torlesse,
Helensburgh,
Dunbartonshire.

AMSTRAD ANGER

SO AMSTRAD have finally blown it! After introducing a strong influence of confidence and stability into the home computer market they have withdrawn the CPC-664 after just three months.

I am one of the unfortunate many who purchased the 664 and, after I read of the 6128 introduction, I thought that Amstrad would at least offer some means of upgrading the 664 to a 6128. Then I wondered what support would be available for the 664 in the future.

I wrote to Amsoft asking these questions and received a reply full of sales waffle which totally avoided answering these questions and seems to typify Amstrad's attitude to 664 owners. I would not be at all surprised if Amstrad had seriously miscalculated the date on which the 6128 development would be complete, which it almost certainly was when the 664 was released, and went through with the 664 launch in order to recover its development costs from the unsuspecting 664 purchasers.

I was amazed to hear Alan Sugar on *Database* stating that the 664 would be supported as it is compatible with the other Amstrad computers. What rubbish! I have already

YOUR Letters

encountered compatibility problems with 464 programs, and 6128 programs will aim to use the extra memory so they certainly will not run on the 664.

Amstrad owes it to 664 purchaser to offer an upgrade or trade in on the 6128 and I hope other 664 owners and magazines like *Your Computer* continue to pressure Amstrad until they do.

Prospective purchasers of the PCW-8256 beware. What will you do if this is dropped after such a short period and after the 664 experience, can you be sure that Amstrad won't?

J. F. Palmer,
Crawley,
Sussex.

'BRAVE GAMBLE'

ON READING Stephen Meadows' letter in Octobers *Your Computer*, I was amazed at its content.

Mr Meadows explains to us that the TMS 9900 has an eight bit data bus, it does in fact have a 16 bit data bus. Its major handicap is that it has a 15 bit address bus which only allows it to access 32K of Rom/Ram directly.

He also claims petty reasons for the machine's failure, such as the position of the power switch. There are quite serious reasons for the lack of popularity:

☐ the machine was initially over priced, due partly to the high chip/descrete component count and partly to the bad marketing strategy.

☐ early models needed a special American monitor.

☐ the software was overpriced and I personally have never seen any third party softeware for the machine.

☐ the TMS 9900 chip was marvelously suited to control systems but not suited for a micro.

☐ the expansion was
a) all supplied by Texas.
b) expensive.

☐ the Basic was, to put it politely, double-plusmega-slowwwww — not to mention the dreaded Call extention.

I am not a fan of the QL or Uncle Clive, I crack up if someone says 28 days. However the QL was a brave gamble which would have paid off if the designers had used 3.5 inch drives instead of the Microdrives.

Sinclair is a pioneer but a little eccentric, though not completely incompetent.

6800 v 9900 ??????

For me its a 68000 every time.

D. M. Platt,
Maltby,
Rotherham.

Line 64504 in Listing 3 of October's Spectrum game, Impulse, was left out. It should read:
501617DCOAD718B1 = 711
In the same issue line 55 in Listing 2 for Midnight Express should read:
Q=0:FOR T=1 TO 39 STEP 2:X$=MID$(Z$,T,2):GOSUB 90

*To increase the number of lines available! in BBC Pikchachanja it is not enough just to alter the value of NUMLN as suggested? in the article. Instead, replace every occurance of C2 with C1+6*L, and delete the fourth statement in line 80. If you also replace BOO in line 750 with DOO you can have up to 80 lines.*

ADD-ON EXTRA

LP-1 Lightpen

CPC-464 or 6128
Amstrad
£19.95
Simple to use menu driven software for tape or disc that works in Mode 1 in 4 colours and Mode 0 in 16. Line drawing, box, circle and triangle facilities are provided as well as zoom and copying screens can be saved at either speed but dumping to printer is only on Amstrad's DMP1. A strategy game and use of the lightpen in your own programs instructions are included.

AMX Mouse

Graphics Package
Amstrad
£79.95
A conversion of the highly acclaimed BBC package for the Amstrad. For your money you get an art package, an Icon designer, and Basic extensions to allow you to use Mouse control in your own programs. Advanced Memory Systems are on 0925 602959/602690.

Delta

Second Processor
BBC
£115
This board consists of a 65C2 processor and 64K Ram. Watford claim that the board doubles the speed at which any program will run, and is 50 per cent faster than the official Acorn version. They also claim complete software compatibility. Tel 0923 3774/40588.

Pacesetter

Interface/Controller
Spectrum
£14.95
Space Invaders still zap you? Just can't get through that room in Jet Set Willy, well this could be the product you're looking for. You stick the Pacesetter in the back, and as well as a Kempston interface you have a control which allows you to slow a game down virtually to a standstill if desired. Any game which doesn't mess around with the interrupt procedures will respond to the treatment. Nidd Valley Micro are on (0423) 8644b8.

HARDWARE hitlist

Camel Polyprint

■ *Spectrum*
■ *Cambridge Microelectronics*
■ *£44.95*

NOT ANOTHER parallel interface! Yes, but this one's different. It will allow the usual LList, LPrint and small screen copy — bit image, somewhat oval circle — like the well-tried Kempston but without the option to copy using the printer's character set.

The customary and rather insubstantial add-on box with through port has eight 1K banks on Eprom, any 1K displacing the 15-16K area of the Spectrum Rom containing English, French, German, Danish, Swedish, Italian and Spanish, and a bank to change Tasword 2's character set to any of these.

It is specifically designed to be used with Epson's FX80, and Cambridge Microelectronics provide information to software switch the printer in conjunction with the character set changes. A list of addresses in Masterfile could thus be printed each in an appropriate character set. The unit is not cheap at £44.95 plus VAT.

However, for the specialist who wants a number of foreign languages and who doesn't relish poking Tasword 2 — I've done it and it takes a very long time — it's very handy. And the nicely mapped bits of Eprom can be used for other purposes — instructions are given for saving the character sets first. Not a hack interface, then, but rather one for the professional user or enthusiast. Cambridge Microelectronics is on 0223 314814.

Lightpen

■ *CPC-464 or 6128*
■ *DK'tronics*
■ *£24.95*

WITH THE right software, a lightpen is one of the most useful add-ons you can buy. Graphic design, control of games or business packages are all possible. So how does this offering from an established Spectrum hardware specialist measure up?

On loading the screen uses Mode 0 to display the five main menu's which you can step forwards and backwards through to select the various functions shown as small pictures or "icons". Screen's can be loaded or saved to cassette or disc although no catalogue function is provided.

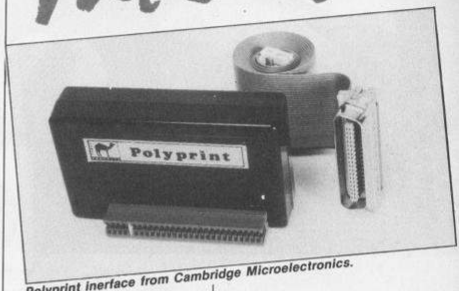
The graphic software is not protected so that you can transfer it to disc or alter the speed screens are saved at. Drawing on screen is possible in one of 10 colours and four thicknesses as well as a nice air brush facility, although the lightpen flickers slightly fine movement of the cross on screen can be filled with any of the 10 colours but dark areas or backgrounds are best left till last as the pen has to be moved by the cursor keys across them.

Other facilities allow you to draw curves, boxes and circles and place text horizontally or vertically. Areas of the screen can be duplicated, reduced or enlarged in four set sizes. Fine detail can be achieved using the scratch pad which enlarges an area of the screen for editing of single pixels.

A comprehensive and well written manual gives full details of printing screen's using them in your own programs and writing programs to use the lightpen.

In conclusion a good hardware, software package that will appeal to most users especially the younger ones because of the use of icon's.

The lightpen is available from computer dealers or direct from DK'electronics on 0799 26350.



Polyprint inerface from Cambridge Microelectronics.

Rom card

■ *CPC-464 and 6128*
■ *Arnor Ltd*
■ *£10.39*

IT'S A BUMPER month for Amstrad add-ons as independent manufacturers realise there is a serious market out there. Perhaps Alan Sugar's truck driver's do a little word processing on the side. This Rom board takes four Roms and plugs into Arnor's Maxam assembler board; it's useless without it, but cheaper than the Micropower board.

To go with the Rom board, Arnor has launched two packages: Utopia, a utility package, and Protext, yet another word processor. Utopia might not transport you to paradise, but it does seek to patch up a few holes in the Amstrad operating system and the DOS.

Many of the commands will be familiar to Beeb owners, with Help, Spool, Printon, Romoff and many more, it therefore comes as no surprise it is from the author of Toolkit for the Beeb.

A particularly useful command is Romoff which allows any Roms you choose to be switched out. This saves you removing disc interfaces or other add-on's.

Utopia is £26.04 for a 16K Rom, and Protext £34.74. Protext is a comprehensive word processor, with the usual formatting and printer control functions.

In October's Hardware Hitlist page, Robcom was wrongly refered to as Robocom, a totally unrelated computer company. Robcom can be contacted on 01-209 0118.

WHAT TO BUY FOR CHRISTMAS

Lee Padden tests possible Xmas presents.

THIS CHRISTMAS may well be a bonanza for manufacturers and consumers alike. Competition is likely to be extremely fierce with attractive deals on offer from most micro makers. Next month, we'll examine budget micro's making a bid for pride of place in the christmas stocking, this month we turn the spotlight on some more up-market machines in the price range of £180 and upwards which loosly come under the heading of home micro.

These range from the QL at its new highly competitive price of £199 all the way up to the ACT F1E and the recently announced Atari ST.

The table gives an outline specification of the 10 contenders. When talking about price, you must bear in mind what you get for your money. Many micros in this price range come complete with some form of storage, and perhaps a monitor or mouse. Next comes the amount of read only memory (Rom), random access memory (Ram), the type of processor and the speed at which it runs.

The amount of Rom gives some idea of the power of the machine's operating system and resident language, although it must be stressed that in the case of the Einstein and the PCW8256, the language is loaded in from disc after power-up.

The figure for the Atari ST is provisional as the operating system is still being finalised at the moment, so it is only available on disc and not in Rom. Atari intend to produce a 260ST in the new year once the operating system has been sorted out, and this may well be around the £600 mark.

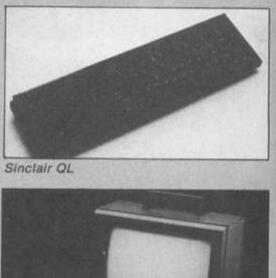
The processor and speed give some idea of the raw power of the system, although this is only a very approximate guide, ie despite the QL running a more advanced processor at twice the speed, its Basic is still slower than the BBC 128.

Graphics are still harder to be objective about. The figures given are the maximum in all cases. Usually, in order to get very high resolution graphics, colour or memory has to be sacrificed. It is also impossible to read 80 column text on a domestic TV.

The QL, F1E and 8256 have no sound save a very basic beep, usually to indicate a mistake of some variety. The rest either go with the ever popular General Instruments chip, which has a large, if not terribly subtle repetoire, or go

Machine	Price	Memory & processor	Display	Sound	Ports	Keyboard	Peripherals	Software
Amstrad PCW8256	£460 inc mono monitor printer & 3" disc drive	256K Ram — Z80A at 4Mhz	90 × 32 Text 720 × 256 Graph Mono	Beep		Full travel 4 function + WP keys	RS232	CPIM, WP, and GSX bundled
Amstrad CPC6128	£399 inc colour monitor printer & 3" disc drive	128K Ram 48K Rom Z80A at 4Mhz	80 × 25 Text 640 × 200 Graph 16 Col	Voices	Joystick, printer, disc sound.	Full travel 10 function/ number keys	RS232, speech light pen, TV modulator	Games, utilities and business progs. Quality much improved recently
Amstrad CPC464	£299 inc colour monitor & cassette	32K Rom 64K RAM Z80A at 4Mhz	80 × 25 Text 640 × 200 Graph 16 Col	3 voices	Joystick, printer, sound	Full travel 10 function/ number keys	RS232, speech light pen, TV modulator	ditto
Acorn BBC128	£499	128K Ram 48K Rom 6502 4Mhz	80 × 32 Text 640 × 256 Graph 16 Col	3 voices filtering & modulation	RS423, Print RGB, disc, joystick	Full travel, 10 func keys	Modem, speech 2nd processor mouse, net. Disc drive	Lots of utilities and business, few games.
Enterprise	£249 + Joystick	128K Ram 96K Rom 6502 at 4MHz	80 × 25 Text 672 × 512 Graph 256 Col	3 voices filtering stereo	Printer, RGB joystick, net cartridge	Membrane type, 8 func keys		Very little, mostly poor conversions.
Sinclair QL	£199 inc microdrives	128K Ram 48K Rom 68008 at 8Mhz	80 × 25 Text 512 × 192 Graph 16 Col	Beep	RGB, Net Cartridge 2 × RS232	Membrane type, 4 func. keys	Disc, modem printer, joystick	Bundled business software, some languages, few games.
Commodore C128	£269	128K Ram 64K Rom 8502 1 or 2 Mhz 16 Col	80 × 25 Text 640 × 200 Graph 16 Col	3 voices filter modulate	Video, cart serial, user joysticks	Full Travel, 4 Func, number keys	Disc drive modem light pen, mouse	CPIM compatible and can run most C64 software
Atari 520 ST	£750 inc 3½ disc + mouse + mono monitor	512K Ram 192K Rom 68000 at 8Mhz	80 × 25 Text 640 × 400 Graph 512 Col	3 voices + midi in, out & thru	RS232, joystick disc, cartridge	Full travel 10 Func + number keys	Hard disc modem	Business and games software in preparation.
Tatung Einstein	£499 inc 3" disc + momo mon.	80K Ram 8K Rom Z80A at 4Mhz	40 × 24 Text 256 × 192 Graph 16 Col	3 voices	Net, disc, printer, aid RS232	Full travel 7 func keys	80 column displayd	Not much good software.
Apricot F1E	£685 inc 3½" disc	256K Ram 32K Rom 8086 at 5 Mhz	80 × 24 text 640 × 256 graph 16 Col	Beep	Printer RS232, RGB	Full travel 10 func + number keys	Hard disc modem	Mainly business, runs MS/DOS, and BBC basic progs.

BBC 128



Sinclair QL

Amstrad CPC-464

Commodore C128

PCW-8256

for something a little more upmarket in the way of filtering and modulation.

Ports are a problem. Most peripherals such as disc drives, joysticks, printers and modems have a recognised standard port, which it seems micro makers do their best to avoid. Still, at leas this is some progress from the "leave part of the circuit board hanging out the back" approach common in cheaper machines.

The much maligned RS-232 interface is a case in point. Only the Atari has a "proper" 25 way connector. The BBC uses an RS-423 interface, which does the job, given the appropriate lead, but the QL uses a totally non-standard format, using phone-type plugs. Most joystick ports are of the "Atari" style nine pin format, the Enterprise needs an adapter. All except the Einstein, QL and Apricot have a cassette interface. Most machines also have an expansion port, but this is of little use to the average user.

You should certainly approach claims that these ports are standard with a fair degree of scepticism, and work out the real cost of attaching any gadgets you've got your eye on.

Keyboards are not usually a problem in this price range. With the possible exception of the Enterprise, the Einstein and the QL there should be few complaints. The BBC in particular has attracted warm praise from key bashers everywhere. The table mentions extra functions keys available over and above the Qwerty set, the obligatory shift, delete and escape keys. A numeric keypad can often speed up data entry.

One unique problem with the F1E is the keyboard is coupled to the main unit not by a cable, but by an infra red link, so you have to keep a nice tidy desk for this one.

Peripheral availability is rarely a problem with established micro's like the BBC, and most manufacturers give their machines hardware support.

If an RS-232 add-on is available, the machine should be able to use most modems, assuming suitable software is available.

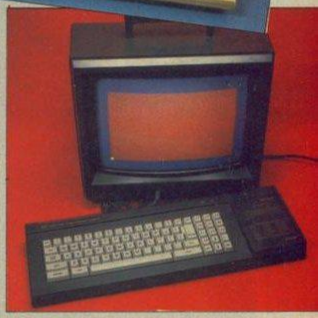
One of the most important factors when choosing a micro is software. After all, unless you're going to get down to programming the thing yourself, how good the machine seems to be to you will largely depend on how good the available software is. Many a potentially good machine has ended up on the scrap heap for want of good software. It is always difficult to gauge how good software support is likely to be for a new machine.

PCW8256: A specialised word processor rather than a true home Micro, amazing value for money, no resident Basic, monochrome low res graphics. Bundled software includes Dr Logo, CP/M+, and GSX — a graphic system.

CPC6128: Possibly the best all round buy this Christmas for someone who wants to get into computers, has a bit of word processing or data handling to do and is not averse to playing the odd game. Hard to fault at the price. Easy to use, fast Basic, rather rudimentary disc system, and a flood of interesting peripherals arriving.

BBC 128: Looking a bit long in the tooth now, Beeb has changed little since its launch over three years ago. It has a massive cult following among hardware freaks. Software is rather patchy with the odd really stunning title among the froth. Perhaps the sudden expansion in memory will stimulate the software market a bit. The best machine for communications.

Above: Atari 520 ST. Below: Enterprise 128. Below right: Amstrad CPC 128.



Enterprise 128: First rumoured to be on the way in 1983, after a long gestation, it was virtually stillborn. May still recover given a stiff transfusion of good software. Technically superb, it probably represents the end of the line in the evolution of the eight bit home micro.

Act F1E: A cut down version of Apricot's highly successful F1 business machine, it will not only run Apricot's range of business software, but also most programs written in BBC Basic in a bid for the education market. Runs MS-DOS, the most widely used PC operating system.

Einstein: While by no means a bad machine, the Einstein has been unable to make much of an impression on the market and has little third party software support. A bit bulky, it runs CP/M but needs an add on 80 column graphics board to give it full compatibility. Disc software on the pricy side.

Atari 520 ST: Very much an unknown quantity at this stage, possibly a better bet for next christmas. Still, if you must have the best set of wheels on the street, this is definitely the micro getting the most column inches devoted to it at the moment. If it's all true, with a user friendly operating system, MIDI and superb graphics, it'll be a huge hit.

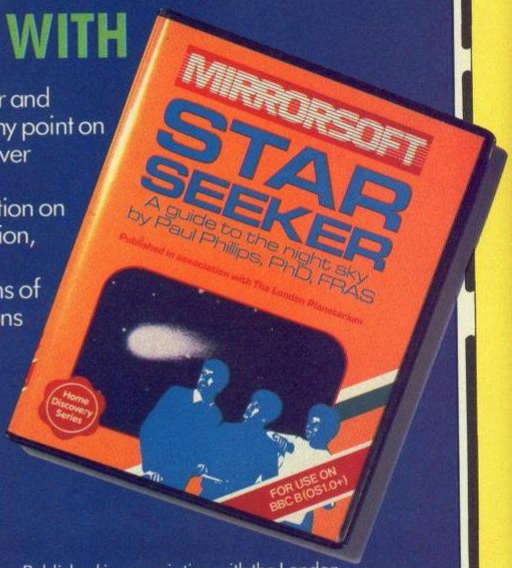
Commodore C128: As yet it isn't certain this will be around in time for christmas. Compatible with all CBM-64 software, with CP/M thrown in for good measure, it has superceded the C64 in the States, and presumably will do here as well, once Commodore have got rid of their stocks of CBM-64's. May well be a good compromise between a business and games machine.

Sinclair QL: Virtually given up for dead after an apparantly never ending series of teething troubles, the price cut and the new improved versions of the bundled software might just rescue this one from the realms of academic curiosity piece. Slow and cumbersome Basic, awful keyboard, and of course Microdrives. Monitor be specially adapted.

Amstrad CPC464: Older brother of the 6128, it suffers in comparison. But if £300 is your absolute limit, and you're happy with cassetes, you could do a lot worse. If you want a printer, make sure its the new 2000 rather than the awful DMP1. ■

MIRRORSOFT

FOLLOW HALLEY'S COMET...AND MUCH MORE WITH



- Construct and print out star and solar system maps from any point on Earth at any time or date over several centuries
- Call up a mass of information on a particular star, constellation, or planet
- Follow the relative positions of the stars and orbital motions of the planets in the Solar System
- Plot the path of Halley's Comet as it crosses our skies this winter on its once-in-a-lifetime visit
- Predict the orbit, phase, and age of the Moon

NOW WITH SPECIAL EXTRA BOOKLET ON **HALLEY'S COMET!**

Published in association with the London Planetarium, Star Seeker and its companion program, Solar System, gives you all this and much, much more. The comprehensive manual provides background information, latitude and longitude tables, extensive ideas for using the programs, and complete lists of the stars and constellations featured.

Price £9.95 Available for: Commodore 64, BBC B/Electron, Spectrum 48K, MSX
Disk versions also available for Commodore 64 and BBC versions at £12.95.

SOFTWARE Shortlist

Paradroid

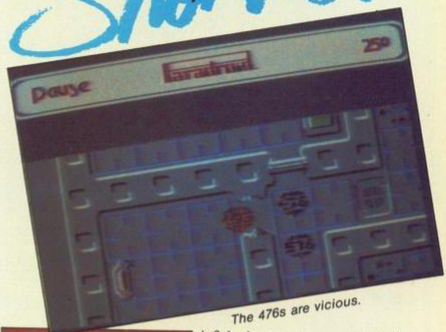
- CBM-64
- Hewson Consultants
- Shoot-'em-up
- £7.95

★ ★ ★ ★ ★

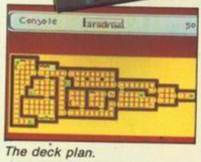
THIS IS PROBABLY the most original and striking game to appear from a dark horse software house since Llamasoft released Gridrunner. And it is far more than just a shoot-'em-up, though a certain amount of zapping is essential to survival in this highly addictive game.

Your paradroid materialises on board a space freighter where mutiny if rife among the robots. Your job is to clear each deck of the dissident droids. You can either shoot them in the traditional way or take them over. You start out as a humble 001 influence device but you can work your way up through the social scale by taking over insignificant 123 disposal droids, 249 servants all the way up into the eight or nine hundreds. All the different types of droid are represented on the main screen as floating numbered globes, but when you taken one over you get a portrait of the machine you are and the one you are about to become together with specifications.

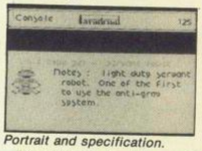
The takeover sequence is highly original and calls for a deal of quick thinking and pattern recognition. First you centre your joystick — your current host changes colour, then crash into your proposed victim. The description screen appears, followed by a screen depicting the logic circuits of the two machines divided by a central segmented column.



The 476s are vicious.



The deck plan.



Portrait and specification.

By moving the joystick up and down and firing charges along the circuits the aim is to turn the central column to the colour representing your side of the screen. If the victim puts up a fight the struggle can end in deadlock, rejection or burnout. If you die, a whole load of static comes up on the screen followed by the message "Transmission terminated". Another nice touch of sophistication in this program.

There are 24 classes of robot. Each has its own personality — the 476s are very aggressive and hang round in gangs quite often shooting each other if they get carried away — but they are nowhere near as mean as the 711s which pack disrupters capable of blowing up everything in the vicinity.

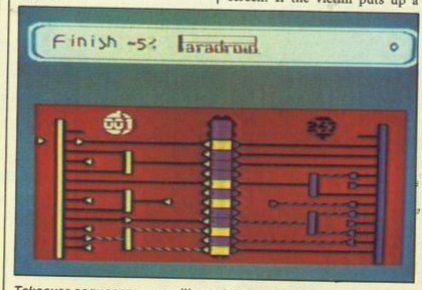
The toughest robot of all is the 999. The only way to take this out is to take it over. It is, however, very resistant to your influence so transfer to another robot before it rejects you — there is no lonelier feeling than turning back into a 001 on a deck full of 716s, except possibly catching a train from Shrewsbury which turns out to be full of West Ham supporters.

When the last droid on a deck is eliminated the deck lights go out and the strange background warbling noise — which sounds like someone calling "here, kitty-kitty" dies away and you score bonus points.

With over 400 screens of playing area and 20 decks at £7.95, there are eight spaceships, plenty for your money. Hewson has come up with the goods just when some of its fellow little league colleagues seem to be nightshades of their former selves.

Paul Bond.

(continued on page 39)



Takeover sequence — you'll need to think fast.

BEHIND THE SCREENS

Andrew Braybrook.

Andrew Braybrook, author of Paradroid, first started games programming the hard way — in Cobol on a mainframe, when working as an accounting packages analyst/programmer at Marconi in Chelmsford. Pioneering real-time computer games with Space Invaders built out of greater-than/less-than signs was good schooling for getting the best out of the Commodore 64. "On the mainframes there were no real graphic facilities, and the action only took place when you tapped a key. That Space Invaders game as the first one at Marconi that went on playing by itself."

Initially the Paradroid backdrop was planned to be a plain blueprint, but Hewson decided this would look too primitive. Having experimented with a pressed metal title screen, Andrew extended the concept to one deck, then to the whole ship.

How did the game's transfer sequence come about? "I couldn't think how to show the takeover so I thought of making a little game out of it. Steve (Turner) was playing about with one of those logic circuit designing programs on the Spectrum and I thought I can use this."

And the smooth-etc scrolling? "It doesn't scroll the screen as such. You would need to access all the screen area. We found that's OK if you just go up and down or left and right but if you go diagonally you get a sort of step effect. So we refresh the whole of the screen all of the time, 17 times a second."

ATARI 520ST SPECIFICATION

MEMORY
512K RAM (524,288 bytes)
192K ROM expandable to 320K
Port for added 128K plug-in ROM cartridges
200K TOS operating system

GRAPHICS
Individually addressable 32K bit-mapped screen with 3 screen graphics modes:
320x200 pixels in 16 colours (low resolution)
640x200 pixels in 4 colours (mid resolution)
640x400 pixels in monochrome (high res)
16 shades of grey in low res mode
512 colours available in low/medium res
8 levels of each in red, green and blue

ARCHITECTURE
4 custom designed chips:
GLUE Chip - MMU, Memory Mnagment Unit
DMA Controller - Graphics Processing Unit
16/32 bit Motorola 68000 processor at 8MHz
eight 32 bit data registers
eight 32 bit address registers
16 bit data bus/24 bit address bus
7 levels of interrupts/56 instructions
14 addressing modes/8 data types

DATA STORAGE
High speed hard disc interface
Direct memory access 50 Megbytes per second
RS232 Centronics (Parallel) interface
Two joystick/mouse sockets
Dedicated floppy disk controller

DISK DRIVE
500K (unformatted) sided 3½" floppy drive
540K (formatted) double capacity

SOUND AND MUSIC
Sound Generator
Frequency control from 30Hz to above audible
3 voices (channels) in wave shaping sound in addition to a noise generator
Separate frequency and volume controls
Dynamic envelope controls
ADSR (Attack, Decay, Sustain, Release)
Noise generator
MIDI interface for external music synthesisers

KEYBOARD
Separate keyboard microprocessor
Standard QWERTY typewriter styling
Ergonomic angle and height
86 keys including 18 function keys
Numeric keypad with 18 keys including ENTER
One-touch cursor control keypad

MONITOR
12" screen - high res monochrome monitor
640x400 monochrome resolution
Note: Some of the above specifications are pre-release and may therefore be subject to change

VIDEO PORTS
Display - Low Resolution - 40 columns
Mid/High Res - 80 columns/640 pixels
Medium res RGB (Red/Green/Blue) output
High resolution monochrome (Black & White)

COMMUNICATIONS
Bidirectional centronics parallel interface for printers, or modems capable of input/output
RS232C serial modem/printer interface
VT52 terminal emulation mode
Serial port - Baud rate up to 19,200
High speed hard disc interface
Floppy disc controller (Western Digital)
2 joystick ports (one for 3 button mouse)
MIDI interface for external music synthesisers

GEM WIMP ENVIRONMENT
WIMP - Window Icon Mouse Pop-down menus
Two button mouse controller
Icons/Pull down menus/Windows
GEM VDI - Virtual Device Interface
GEM AES - Application Environment Services
GEM BIT - Bit Block Transfer
Real time clock & calendar

SOFTWARE
GEM environment
with user friendly Macintosh style operation
TOS - Transfer Operating System
Atari's own system based on CP/M 68K with hierarchical directory & file structure plus a rich set of MS DOS & UNIX command structures
BOS - Business Operating System
Allows any standard BDOS program to run under GEM desktop
GEM BASIC - Atari's own BASIC
and GEM WRITE word processor
Revised BASIC and DR Logo
(originally written by Digital Research (DR))
Very much like those on other machines
except for the extensive use of pull down menus, mouse control and windows

VARIOUS
Dimensions: 470mmx240mmx80mm
Separate external power supply
Expansion: 3½" floppy disk drives (500K/1,000K) (two drives can be connected)
3½" 10MB hard disc
CD (compact disc)
Dot matrix & dot/laser printer (black)
Colour dot matrix (colour)
RGB & monochrome monitors

LANGUAGES
BASIC & LOGO supplied
Many others will soon be available, including:
Assembler, BCPL, C, Cobol, Compiled Basic
Lisp, Modula-2 and Pascal

MACINTOSH v F1e v 520ST

Imagine a Fat Mac - the 512K Apple Macintosh - but with a bigger screen, a far bigger keyboard with numeric keypad, cursor and function keys, and colour. That gives you an idea of what the Atari 520ST is like, except for two important things. First the Atari seems faster. Second the Atari system is about one third of the price.
June 1985 - Jack Schofield - **PRACTICAL COMPUTING**

ATARI 520ST

POWER WITHOUT THE PRICE

THE NEW ATARI 520ST

Under the new leadership of Jack Tramiel (former boss and founder of Commodore Business Machines), Atari Corporation have marked their entry into the world of business/personal computing with a machine which leaves the competition standing. Tramiel's slogan 'Power Without the Price' has been implemented in the manufacture of the new 512K Atari 520ST colour computer which offers the user amazingly high performance at an incredibly low price. Launched as a work-station, this new system incorporates seven software packages as well as the 520ST computer with 512K RAM, mouse controller, high resolution monochrome monitor (640x400), 95 key keyboard (with 18 key numeric keypad), MIDI interface, GEM and a 500K 3½ inch disk drive, all for the package price of only £651.30 (+VAT = £749). Dubbed the 'Mac beater' and the 'Jackintosh' (after Atari's Chief, Jack Tramiel), Atari's new machine has been directly compared with the Apple Macintosh RRP £2585 (+VAT = £2985) which offers similar features and capabilities but at a much higher price. Favourably reviewed by the UK's highly critical specialist computer press, the 520ST is likely to make a great impact in this country as a sophisticated alternative to an IBM PC, APRICOT or APPLE MACINTOSH. Unlike its overpriced competitors, the Atari 520ST can be linked up to a colour monitor to unleash a choice of up to 512 colours. The addition of colour brings out the full potential of graphics packages such as GEM.

USER FRIENDLY GEM OPERATING SYSTEM

The power of the ST is harnessed and made user friendly by the new operating system 'GEM' from Digital Research. GEM stands for Graphics Environment Manager and allows a user friendly colour or B/W graphics interface which closely resembles that of the Macintosh. This similarity extends to the use of moveable resizeable windows, icons to represent objects such as disks and disk drives, and the use of pull down menus and a mouse. The advantage of all this is that the computer becomes extremely easy to use. GEM has now been implemented for the Acorn, ACT, Atari, IBM, ICL, and Olivetti. Software written for GEM on one computer should also run under GEM on another computer. This will enable the market to quickly produce a large library of standard interchangeable software.

FREE SOFTWARE AND FUTURE EXPANSION

The Atari 520ST comes supplied with seven free software packages as listed below: 1) TOS -Transfer Operating System based on CPM 68K. 2) GEM Graphics Environment Manager by Digital Research (DR) giving a WIMP (Window, Icon, Mouse, Pull down menu) environment. 3) DR GEM Paint for creating graphics masterpieces. 4) DR GEM Write for word processing. 5) Logo learning language to enable you to write your own programs easily using turtle graphics. 6) DR Personal Basic a powerful user friendly version of the Basic programming language. 7) BOS operating system giving you access to dozens of business applications packages already available on the market. Designed with future expansion in mind, the ST also features a host of different interfaces to the outside world and an impressive list of accessories is planned. Atari will soon be releasing a 1000K (1MB) 3½ inch disk drive, and a 15MB hard disc storage system as well as a mass storage compact disk (CD) player capable of storing an entire 20 volume encyclopaedia on one disk. A full range of inexpensive printers are planned including dot matrix, daisywheel and thermal colour printers. With its unbeatable graphics, speed and software at a price which is far below that of any comparable personal computer currently on the market, the ST is all set to do battle with the competition. To receive further details of the ST from Silica Shop, just fill in the coupon below with your name and address details and post it to us.

Silica Shop Price: £651.30 + £97.70 VAT = £749.00 This price includes:

★512K RAM ★B/W MONITOR
★MOUSE ★500K 3.5" DISK DRIVE
★GEM ★KEYBOARD (95 KEYS)

"Atari's new corporate image as an aggressive low cost computer maker is likely to mirror that of Commodore where Mr. Tramiel established the maxim that 'Business is war'."
August 21st 1984 **FINANCIAL TIMES**

"This is the only personal computer I know of that comes with a Midi interface as standard."
Peter Bright March 1985 **PERSONAL COMPUTER WORLD**

"The (GEM) version running on the Atari 68000 machine will have the additional advantage of leaving the PC version standing."
Peter Bright June 1985 **PERSONAL COMPUTER NEWS**

"It would seem that GEM offers the ideal operating system."
March 7th 1985 **POPULAR COMPUTING WEEKLY**

"I found it (GEM) extremely easy to use and was very impressed with the way in which it disguises the unfriendly hardware and operating systems lurking under the surface."
Peter Bright Feb 1985 **PERSONAL COMPUTER WORLD**

PRESS COMMENT

"The electronics in the machine are a work of art ... The heart of the 520ST is a Motorola 68000, one of the most powerful 16-bit processors around and in many respects it is close to being a 32-bit chip ... when the machine appears in the shops, I'll be at the front end of the queue to buy one."
Peter Bright - June 1985 **PERSONAL COMPUTER NEWS**

"This machine is significantly more powerful than an IBM PC. If it's possible to design a sure-fire winning machine, this is it."
May 11th 1985 **PERSONAL COMPUTER NEWS**

"... the use of GEM makes the new range of Atari computers a match to the Macintosh (with the added attraction of colour), that they are already being called 'Jackintoshes'."
May 2nd 1985 **COMPUTING**

"The new Atari ST computers truly represent to the consumer what Jack Tramiel is saying — easy-to-use computing power without the price."
March 1985 **ANALOG COMPUTING**

"It (the ST) uses the most modern technology that is affordable, in a package that gives a professional impression."
May 23rd 1985 **POPULAR COMPUTING WEEKLY**

"The Atari ST is one of the most elegant designs I have seen. Atari has used an original and elegant method of memory management which should make the ST faster than any other PC on the market - in any price bracket ... The 64K dollar question is would I go out and spend money for one? To which the only answer is "Try and stop me!"
John Lambert July 1985 **ELECTRONICS & COMPUTING**

"The 520ST is technically excellent ... The 520ST hardware is the new standard by which others will be judged."
July 1985 **YOUR COMPUTER**

SILICA SHOP

ATARI ATARI

WE ARE THE UK's No1 ATARI SPECIALISTS

At Silica we have been successfully dedicated to Atari ever since their products first appeared on the UK market. We can attribute our success largely to the Atari specialisation which we practice and to the user back-up we provide. Rest assured that when you buy a piece of Atari hardware at Silica you will be fully supported. Our mailings giving news of software releases and developments will keep you up to date with the Atari market and our technical support team and sales staff are at the end of the telephone line to deal with your problems and supply your every need. With our specialist bias, we aim to keep stocks of all the available Atari hardware, software, peripherals and accessories. We also stock a wide range of Atari dedicated books and through us, the owners on our list can subscribe to several Atari dedicated magazines. We can provide a full service to all Atari owners and are now firmly established as the UK's NUMBER ONE Atari specialists. Here are just some of the things we can offer to our customers.

★FREE POST & PACKING ON MAIL ORDERS
★FREE NEXT DAY SECURICOR DELIVERY
★INFORMATION MAILING SERVICE
★TECHNICAL SUPPORT TEAM
★HIGHLY COMPETITIVE PRICES
★AFTER SALES SUPPORT SERVICE
★REPAIR SERVICE ON ATARI PRODUCTS

If you would like to be registered on our mailing list as an Atari computer owner, or as a person interested in buying an Atari machine, let us know. We will be pleased to keep you up to date with new Atari developments free of charge. So, return the coupon today and begin experiencing a specialist Atari service that is second to none.

★ ★ ★ Good
★ ★ Average
★ Below par

Interactive Basic Programming

ZX Spectrum
Eigen Software
Educational
£9.95

★ ★ ★

A very useful set of four cassettes which instead of letting books blow your mind, allow your computer to do it for you. Permitting you to type in and program normally while IBP is resident in the machine, it tries very hard to be a blow-by-blow introduction to hands-on home computing.

I think you would have to hang on to your manual — I'm sure most real novices need to have it pointed out to them that there actually is a Beep key, and if you try to type in Beep, all you get is Border BBB, because there are so many other keys to press first.

But common sense permitting, this looks like a very useful guide for beginners provided they can find a human to help them out when they're really stuck.

Seventh Cavalry

ZX Spectrum
Strategy game
Black Knight
£3.50

★ ★

For only £3.50 you don't expect to get wonderful moving graphics. This gives you basic map screen display with very slow-responding commands. Your troop units are represented by letters of the alphabet.

Watch out for the letter I as this stands for, guess what, Indians: it streaks across the screen and massacres all the Bluebellies. Good luck to 'em, I say.

(continued from page 37)

Stealth

- *CBM-64*
- *Ariolasoft*
- *Strafe-'em-up*
- *£9.95*

★ ★ ★ ★

BUCK ROGERS, EAT your heart out. Broderbund's Stealth, now available from Ariolasoft in the United Kingdom, takes the fast-scrolling-flying-straight-down-a-corridor-shooting-at-things format and turns it into quite an addictive scenario. The screen display depicts the rear view of your fighter as it hares at zero feet across the hostile landscape.

In the distance the dark tower casts gloom over the future of your once-proud people. You must blow it up so that they can go back to their former cultural pursuits of bean-eating and watching "V" instead of cowering in the bunker.

You can bank left and right but you cannot change altitude. Nevertheless, the sensation of speed and manoeuvre is exhilarating. You can despatch bunkers, tanks and scouts with gusto and a well-placed rocket. Past the third level you come under attack from heat-seeking missiles which you can dodge by veering to port. At the fourth level, fighters come at you and dormant volcanoes start to figure prominently as features of the landscape. On the elusive fifth level these spew forth lava and present a general traffic hazard.

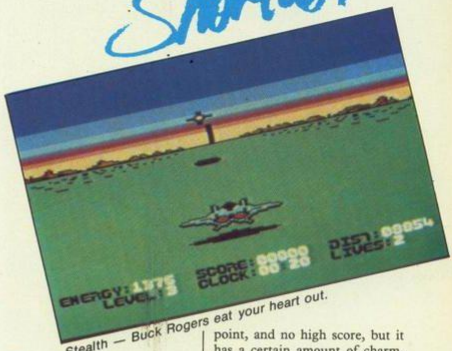
The scouts are particularly interesting. They bounce down from the sky, accompanied by a ground shadow and then zoom up again, adding a bit more perspective to what might otherwise be rather flat visually.

A couple of rather pale attempts at this kind of thing appeared on Dragons and Commodores 18 months back, followed by the release of the actual Buck Rogers game by which they were inspired. I am sure the concept could be stretched a little further but this is one of the most playable variations I have encountered.

Paul Bond.

Donald goes shopping.

SOFTWARE Shortlist



Stealth — Buck Rogers eat your heart out.

Donald Duck's Playground

- *CBM-64*
- *Transatlantic Simulations*
- *Educational*
- *£9.95*

★ ★ ★

THOSE BOYS at Centresoft again, cunningly launching a new label to cover up the fact they're taking over the entire software market. The spurious reason behind this is that the new label is aimed at a younger market.

This game sets out to teach youngsters the basic ideas of work, money, and buying things with money to build a playground — all good sound stuff which will doubtless come in handy in Reaganite America.

There are four different jobs to try your hand at, fruit packing, cargo handling, stacking shelves and signalman. You book Donald in for a shift from one to five minutes, and perform the various tasks. You get paid on a strict productivity basis — with no tea breaks.

After that, its off to Goofy's junk store, or Minnie's hardware store, to buy slides, ropes, ladders and so on for the Playground. After you've picked the item you want, you have to profer the correct change.

All this is done with pretty 3D graphics showing the various cartoon characters strolling around the screen. There is no real aim, in the sense of finishing point, and no high score, but it has a certain amount of charm, and will doubtless appeal to the 5-7 age group it is aimed at, and might actually teach something, like if you vacuum the living room, you might get a pocket money raise. Could this be the start of education programs which actually keep their audience switched on long enough to teach them something?

Lee Paddon.

Blast Compiler

- *Spectrum 48K*
- *OCS*
- *Utility*
- *£26.95*

★ ★ ★ ★

THE IDEA of writing a game in Basic and then getting some dumb compiler to speed it up for you is enough to make some machine code purists take to the veil. But, for the rest of us, this utility could put an end to long nights hunting for an elusive bug which resets the machine when you shoot the fifth invader from the left on the third screen. There have been several Spectrum compilers before, but none have claimed to be as comprehensive as this.

On loading up, you are greeted with the cheery message that around 2K of the memory is free. So, any program to be compiled must be loaded section by section, compiled, and then saved; Microdrives are a must here. You can either compile into machine code, or p-code. P-code has the advantage

(continued from page 39)

of being more compact than machine code, or even sometimes Basic, and, as an undocumented language, may be fairly secure against hacking.

However, it is slower; for this reason, sections of the program can be compiled into machine code. Obviously there are some things which are best done in machine code, and Blast allows users to call machine-code subroutines, and will compile user extensions to Basic. The package is supposed to contain extra Basic commands, but these have been left out due to space; but you do get a useful toolbox of editing commands.

It is difficult to gauge the performance of this program. OCS claim that speed improvements of up to 40 times are possible. This obviously depends on the length of the program, the amount of calculation, and the way the program is written. The manual is currently undergoing revision, but the version with the review copy was hard work. Despite this, it seems that Blast has lived up to expectations, and is by far the best Spectrum compiler on the market. OCS is on 0993 812700.

Astro-Clone — another gem from Hewson.

Astro-Clone

- *Spectrum*
- *Hewson Consultants*
- *Arcade adventure*
- *£7.95*

★ ★ ★ ★

ANOTHER GEM from Hewson matches variety of gameplay with excellent animated graphics. Supposedly the third part of Steve Turner's Dragontorc trilogy, it is obviously something quite different, but is none the worse for that. The game is split into strategic, space combat and ground combat phases. The ground combat phase is where you are on the opening screen, with your Astro-Clone in his two-room spaceship.

On the lower part of the screen lies the control panel. To the left is an icon panel; this tells you what effect the joystick has at any point in the game. There is a message screen next to this, and to the right of this two square alert lights. The top one goes red to draw your attention to the message screen. The lower one goes yellow if those old Hewson bugbears the Seiddab are in the next room, red if they join you.

Your mission is to destroy the main launch computers in all the Seiddab bases to gain control of the stargate sectors shown on the strategic map. But before you access the strategic phase you must take off, enter the space phase — a Defender-style sequence and eithe. dock with a Seiddab starbase or slip through the pulsing diamond stargate to another sector. Either way you have to destroy all the Seiddab cruisers first.

If you fly through the stargate, you enter the strategic phase. If you dock with a starbase, you enter the ground combat phase again. In ground phase you have four modes, selection, movement, arm and laser. The arm mode is quite a nifty bit of programming which allows you to control and throw objects in a way unique to this game.

The game requires tortuous problem-solving capabilities — you need to be able to figure out that if you pass the Gravimag over the grating in room 8 a sonic key appears, for starters. And since the location of seven of the starbases change every time the game is played, the game is always slightly different. Publishing a solution for this game is going to be a bit more complicated than it is for something like Nodes of Yesod.

Hewson have excelled themselves once again — full credit to Steve Turner for producing a game that is destined to become one of the cult non-Ultimate adventure games at Christmas. If only because they've actually brought the game out, unlike some of their more flashy big brothers who are good on hype but slow on delivery.

Paul Bond.

Get your kicks with Karateka.

Karateka

- *CBM-64*
- *Ariolasoft*
- *Martial arts game*
- *£9.95*

★ ★ ★

WAY OF the Exploding Fist it isn't, but Karateka has plenty of Oriental charm. Of particular note is the film-like narrative technique: a kind of story is told in the preamble to each fight sequence — we see Princess Mariko thrown into the dungeons by the evil Akuma, and in later sequences we see Akuma sending his henchmen out to work you over as you try to rescue the unfortunate girl.

As rescuer and henchmen approach each other the hypothetical camera cuts between them until they appear on the same screen. You can shorten this process by running forward but it's not advisable as a good kick in the running mode floors you completely.

And here we encounter a major gripe concerning this program. Obviously not wishing to endure the blood, sweat and tears not to mention time consumed in

The Castles of Doctor Creep

CBM-64
Platform game
Ariolasoft
£9.95

★ ★

House hunting is no fun anywhere, let alone in Transylvania. You've made an appointment to visit 13 of evil landlord Dr Creep's castles with a view to purchase.

Not a wonderfully original setting for a standard platform game. But if you like roaming acres of haunted east wings then this game will certainly give you value for money.

The only catch is that it's unexciting to play — mapping out a whole castle so that you can escape requires a lot of to-ing and fro-ing and repetition.

Mummies and Frankenstein monsters hamper progress, together with plenty of very un-supernatural-looking ray guns and force fields.

Despite the large number of castles to choose from all the rooms are made up of the same components — trapdoors, ladders, doors and sliding poles.

Marginally more enjoyable than moving house in real life.

(continued from page 41)

producing the excellent tape version of Ariolasoft's Skyfox, the cassette version of the game is rather hastily implemented. Every time you lose, you must reload. A highly depressing experience — especially if you do something really dumb, like walk backwards off the cliff at the beginning of the opening sequence. I was only testing the joystick, guv. It takes two and one quarter minutes to reload the game — enough time to play a track off your latest Durutti Column album.

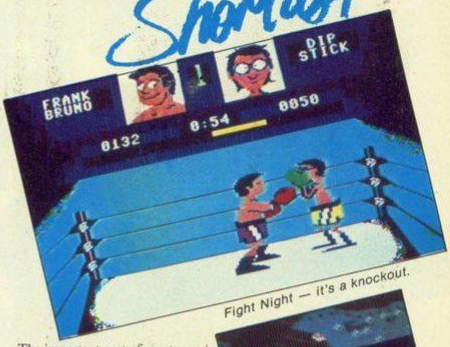
Anyway, if you manage not to fall off the cliff, a member of the local meat-squad turns up and starts chopping away at you. The animation of the figures is slower and more graceful than that in Melbourne House's Fist, but they are smaller, and there is less in the way of sound. The type of blow is restricted to kick and punch, controlled by how you squeeze the joystick button; the stick itself controls altitude of kick — high, middle, low.

You can withstand only a limited number of hits from your opponent. The row of red arrows across the base of the screen indicates how much stamina you have left. Every time he hits you, you lose an arrow. Conversely, the blue arrows on the left of the screen gauge his strength. Each guard wears different headgear and has a different fighting style.

Once you cross the porch the scenario shifts indoors. This also means loading a new section of the game. Here more of the same goes on except that the warlord's pet eagle has a go at you as well. So the moral of the story here is — watch the birdy.

Paul Bond.

SOFTWARE Shortlist



Fight Night — it's a knockout.

Fight Night

- *CBM-64*
- *US Gold*
- *Boxing Game*
- *£9.95*

★ ★ ★ ★

THE WELTER of boxing games continues unabated. First the crisp job of Rocco, then the swinging upper cut of Frank Bruno, but US Gold reckons it can deliver the knock out blow with Fight Night, despite the rather punch drunk nature of the market.

Once the game loads, you are faced with a menu. You can "construct" a boxer, train him, do a bit of sparring, take on a series of progressively tougher challenges, or fight a tournament, several players taking one boxer each.

The important part of construction is to decide whether to make your jab or body blow hardest, and which part of your body can take the most punishment. You also get to choose the colour of your trunks and even skin (including blue, presumably to cater for any aliens who might care for a bout or two).

The actual fight simulation is probably the pick of the bunch. From the ring side seat view, the boxers move back and forth, move their guard up and down, punch and jab. This is no slugfest either, timing is all important. Landing a blow has a number of important effects, it scores you points, it decreases your opponent's endurance, and it puts him off his punch, so a flurry of punches can have a devastating affect, each new punch sending the opponent reeling. Obviously the punch has far less effect if blocked by the opponent's guard, and it is also affected by what the opponent was doing at the time, stepping out, moving in or punching.

There are three three minute rounds, and if no one can deliver a knock out in that time, a decision is given on points. The animation is very nice, with boxers reeling from the punches, and the computer controlled characters have a "special" punch which is great fun to watch (from a safe distance).

Well, Harry, perhaps not a knock out, but I'd say that I've got this one winning all the later rounds after getting away rather slowly and coming out on top in the end. A real contender for the title.

Lee Paddon.

Racing Destruction Set.

Racing Destruction Set

- *CBM-64*
- *Ariolasoft*
- *Race Game*
- *£12.95*

★ ★ ★

REMEMBER SCALEXTRIC? You probably had more fun designing and building the track than actually racing. The cars kept coming off and ending up as a pile of twisted plastic against the skirting board, or worse, you'd get a short circuit and the transformer would blow up. Well, this game is rather similar, most of the effort goes into designing the track, with curves, cross overs, jumps, flyover and so on. You can also customise the car, anything from a fully fledged racing machine to a Morris Traveller.

But then you get to the actual racing bit. A split screen, one or two players, a plan view of the road! I'm afraid this will take a lot of selling to the Pole Position fraternity, used to an over-the-shoulder view. Despite this, it's quite fun, with the usual accelerate, brake and steer.

The jumps are a nice feature, you have to approach these at just

Star chart

Xcel

Spectrum 48K
Program Tecniques
Shoot-'em-up
£7.95

★ ★ ★

After one of the prettiest loading screens in Spectrum history, you would expect a pretty devastating game. A log zaps in from both sides of the screen, wow, this must be some game, you start orbiting a planet ready to whiz down onto the surface for a dazzing 3D shoot-'em-up, right? Sorry, wrong.

As long as you don't actually try to play this game, you might think it was something pretty special, but underneath it all is a sort of cross between Zalaga, Galaxians, and every other shoot-'em-up all the way back to Space Invaders. There is a spurious plot and a lot of spurious alien writing which you're meant to pick up clues from, but the guts of the game are to shoot anything that moves, or, on other screens, avoid the trees — simple really.

Ace

Commodore 64
Cascade
Fight emulator
£9.95

★ ★ ★

When Air Combat Emulator was released for the C-16, it filled a need for software, let alone flight simulators for that machine. It's up against tougher competition on the CBM-64, so a few more goodies have been injected into this fight and fly scenario. You can brush up your in-flight refuelling and choose different weather conditions. There are ground and naval targets as well as hostile fighters. It has a co-pilot option and synthesised speech which keeps the crew informed as to their status. One guy does all the flying and the other does weapons control. Tanks, helicopters, SAM sites, all the fun of a serious deterioration in East-West relations is here.

(continued from page 43)

the right speed to come down on the reverse slope of this or the next jump. If racing soon looses it's appeal, then you can always shoot the opposition off the road! This does tend to make the races rather short, but fun.

While this game has got plenty of chrome, with loads of different tracks and cars, it doesn't grab you the way Taledega did.

Lee Paddon.

Adrian Mole

- *Various*
- *Level 9*
- *Adventure*
- *£9.95*

★ ★ ★ ★

SEPTEMBER 30: Adrian Mole computer game arrived today. Looks really great. All the old characters there, Pandora, Rat Fink Lucas, Stick Insect, Barry Kent and the rest of the gang. The idea is to make Adrian popular.

October 1: Still playing Mole. Editor starts making noises about deadlines. I said that with over 20k of text loading in four parts, it really needs a long review to get to the bottom of it. He seemed pretty impressed. Managed to get through the game without getting beaten up and scored 55 per cent which makes me a spotty school boy. Its got a load/save option so it didn't matter when the cleaners threw me out at 9 o'clock.

October 2: The editor came to find out how the Mole review was going. I said I was seriously thinking about getting down to it. The game uses a tree structure you see. You make decisions and these affect your rating, and also what happens next in the game. So in one game you'll probably only see about a third of the text.

October 6: The editor just doesn't understand me. Here am I trying to write a masterpiece that will live for ever and all he can think about is his deadline. He just doesn't appreciate that I am a great writer and not just another hack. Even if you've read all the books and stuff, there are still plenty of new situations you can get in. I have now managed to score 78 per cent which makes me a gifted poet.

If you don't know the books, there's a Help system, which gives you some background.

October 9: Magazine going to the printers but, unfortunately, I feel the review still needs a little polishing.

October 10: Get the sack. How ungrateful can you get.

Lee Paddon (aged 13¾).

WHEN DALEY Thompson was momentarily dethroned as the world's top decathlete he is rumoured to have said "I lost my world record and took it like a man — I only cried for 10 hours."

Whether or not Ocean's follow-up to the enormously successful Daley Thompson's Decathlon will bring tears to your eyes, it will wreak havoc on your joystick and/or keyboard. Yes, it's another joystick waggler.

The program features eight events only — and suffers strong competition from other sports simulations like US Gold's Summer and Winter Games, not to mention Activision's old Decathlon and the Tour de

(continued on next page)

Fighting Warrior

- *Spectrum 48K*
- *Melbourne House*
- *Beat-em-up*
- *£7.95*

★ ★ ★

"THE BEST graphics ever seen on a Spectrum", a familiar line in publicity blurbs. But now there is no excuse. Stephen Cargill has upped the stakes once again with cartoon style animation of stunning smoothness and detail.

You have to rescue a princess again (groan). In order to do this you've got to fight your way through a veritable army of monsters, who, being honourable types, come at you one at a time. Just to add to the fun, arrows come hurtling at you as well. You have three sword strokes, walk forward, back, jump and duck. The controls are easy to get the hang of.

The screen scrolls right to left as you attempt to make your way to the cave where the Princess is incarcerated. In the background, a landscape of Pyramids, temples and sphinxs scrolls past.

The fight sequences are beautifully animated, easily surpassing those in "Fist" or "Frank Bruno". Unfortunately, the process of fighting your way through the local heavy mob is a shade boring. Still, perhaps we can hope for the same sort of technique to be used on more complex and absorbing games.

Lee Paddon.

Mcoder III

Spectrum 48K
PSS
Compiler
£12.95

★ ★ ★

A compiler of the old school. Good but not flashy. Copes with most Spectrum Basic, except Microdrive commands. It can cope with floating point arithmatic, produces fairly compact code, and speed increases in the order of 10 to 20 times depending on the sort of commands being used. If you don't need all the flashy extras of the Blast Compiler, or your pocket isn't that deep, this looks like a good second best.

High Rise Horror

BBC
Platform
Rabit Software
£3.99

★ ★

Nasty, brutish and noisy — would be a grossly unfair way of describing High Rise Horror. The game certainly has a crude addictive quality, but not much more.

Armed with only a balloon you must make your way from the bottom of the screen to the top, avoiding or destroying the assorted nasties which whizz mindlessly to and fro at high speed.

Then you can pass to the next stage where the landscape is the same but more crowded.

(continued from previous page)

France. But it has just as much potential appeal as its predecessor.

Spread over two days and two sides of a cassette, the events include pistol shooting, cycling, springboard diving, rowing, tug o' war, taking football penalties and two ski-ing events: the ski-jump and the giant slalom.

No time for the blade on the feather lark with the rowing section. Start pumping away to build up your speed shown at the bottom left of the screen. The display shows an overhead view of two kayaks zipping down the river. World records, i.e. hi-scores, are shown at the top right of the screen to encourage the spirit of competitive joystick destruction.

You stagger from you kayak to the football field — the display shows an overhead view of your footballer as he runs up to slam the leather into the back of the reticule. Your player runs as you either use the alternate left/right keys or pound away at the joystick to build up power for the shot. You control the ball's direction by timing the kick — the angle (or elevation) is controleld by the amount of time that the firebutton is depressed. You get five shots.

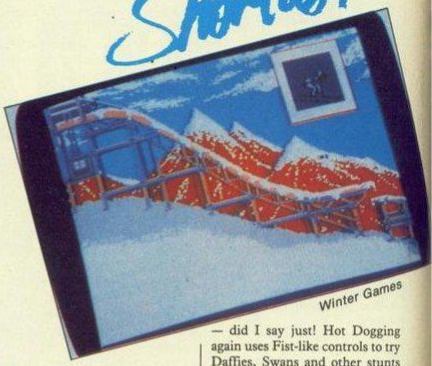
You won't find many footballer's ski-jumping, you may reflect as the pistol signals the gate to open. However, many of them are used to being on the slippery slope or for the high jump. Again continuous left/right movement builds up your momentum, but you must hit the joystick fire-button at the right moment as you come to the lip of the jump.

The tug o' war is impossible. You have a choice of 10 opponents, the weakest of which is totally invicible.

Paul Bond.

Daley Thompson's Super-Test — brings tears to your eyes.

SOFTWARE Shortlist



Winter Games

Winter Games

- *CBM-64*
- *Decathlon*
- *US Gold/Expyx*
- *£14.95*

★ ★ ★ ★

"BREAK OUT the silly hats" was the enthusiastic cry the moment Winter Games hit the office. Up to eight players can choose from 18 countries, and then under their borrowed flags and anthems battle through seven events. Although speed skating and biathlon use the time honoured decathlon — sorry heptathlon — skills of rythmic joystick waggling, the ski-jump and indoor skating are games in their own right.

The freestyle and figure skating look a little like Exploding Fist on Ice as different joystick movements allow you to carry out Camel and Sit Spins and Double and Triple Axel and Lutz jumps. "Figure" is used figuratively (*that's enough figures — Ed*) since you keep skating along the same direction for one or two minutes. With bush hat firmly on head Lynn "Call me Sheila" Dawson was moved to twang "She'll be out in the car park soon".

Toby put down his accordian, wiped the sweat off his brow with his beret and proceeded to win France's first ski-jump gold medal by a convincing display of balance and timing just beating Danneberg. of East Germany. Touch the jump button too soon and you just have to keep your balance in the air and land safely — did I say just! Hot Dogging again uses Fist-like controls to try Daffies, Swans and other stunts off a short ski-jump.

Winter Sports is great family fun — it should appeal to women more than most programs — and looks like being a winner this Christmas.

Meirion Jones.

Chop Suey

- *English Software*
- *Atari*
- *£11.95*

★ ★ ★

KUNG FU seems to be the recipe for success in computer games today, and Chop Suey is English Software's takeaway version for Atari owners. The introductory music is a bit of Bach (Brandenburg control) after which one or two players can get on with kicking each other's heads in.

The two figures appear on a three-dimensional stage, with a few rows of audience in the foreground. The animation is both detailed and colourful. You control your figure with a joystick, though as both figures are identical, it is hard to tell which you're controlling in the melee. The eight joystick positions provide an assortment of jabs, kicks and movements. Blows have to be on target to score. Two "pain-gauges" at the bottom provide a guide to your physical conditions (deteriorating).

The actual fighting seems to be pretty much the same as The Way of the Exploding Fist, so as King Fu games go, this is well done. However, it has few frills (scorpions to jump over; slow and fast modes) so it lacks variety.

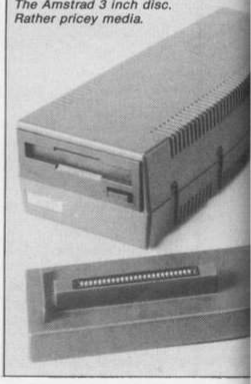
The Opus Challenger 3, including Ram disc and power supply.

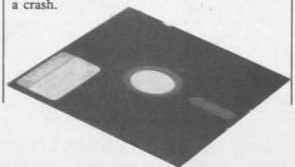


The Amstrad 3 inch disc. Rather pricey media.

A YEAR AGO a disc drive for your micro might have been looked upon as an expensive luxury, but now, with the price of drives dropping all the time, they come within the price range of many people looking to get more out of their machine. So what are the benefits and possible pitfalls of disc systems, and how do you cope with the conflicting claims and jargon?

A disc is much more than a fast cassette recorder, because, like an audio record, you can get to any track instantly. This means that you can virtually use your drive as an extension of the computer's memory. So databases and spreadsheets are no longer limited to 30K or so work space within the computer. To use a cassette like this would be tedious in the extreme.

Even if you don't use such heavyweight programs, a disc drive is reliable, and discs less cumbersome to store, although disc based software can be expensive. Also, when developing your own software, you can rapidly back up each new version, and so speedily recover from a crash.

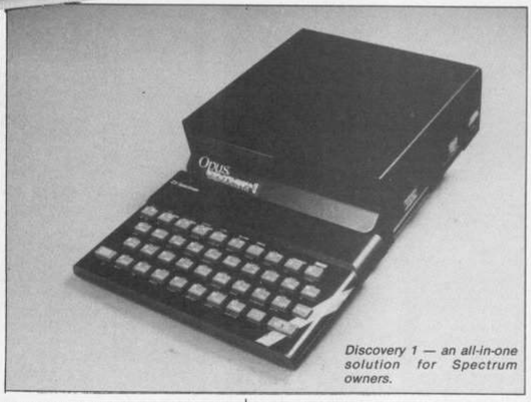


There are three components of any disc system. The drive, which is simply a mechanism which rotates the disc, moves a head across the disc, reads and writes data on the magnetic surface. Then there is the disc interface or controller, which makes the computer electronically compatible with the drive, and the operating system (DOS), the software which drives the interface.

Disc drives come in a number of types and sizes. Most drives not specifically designed for one micro use a Shuggart bus. So you should ensure that any interface you buy conforms to this standard — almost all do. The drive mechanism will either consist of one or two

DISC DRIVE-IN

Buying a disc drive or interface? Lee Paddon puts you on the right tracks



Discovery 1 — an all-in-one solution for Spectrum owners.

read/write heads, ie either capable of reading only one or both sides of the disc at once. Whereas once 40 tracks per side was standard, the quality of disc mechanisms means that 80 tracks is fast becoming the norm. Better still are switchable drives so they can read and write to 40 or 80 track discs. Drives come in a variety of sizes. First came 8inch monsters, then 5¼inch, now 3inch and 3½inch are bidding to become the new standard.

Each have their advantages. 8inch is now obsolete, 5¼inch are cheap, reliable and readily available. 3inch discs are electrically identical to 5¼inch and can be substituted at will. 3inch discs come in a rigid packaging, and so will last longer, but are about three times the price of 5¼inch discs.

3½inch is a relatively new innovation, but since its adoption by Atari for its ST, it may become the front runner. It offers half as much space again as its main rivals, and is just as rugged but a good deal cheaper than 3inch.

Dual drives are a nice luxury, it allows you to protect yourself from disaster by regularly backing up your working disc to prevent a careless error ruining hours of work.

A final consideration is whether you get a built in power supply. If you have to rely on your micro for juice, it will seriously limit the number of drives or other gadgets you can add on.

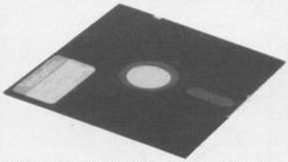
The electrical interface and the operating system are usually purchased as a package. Although each has a clearly defined function, most disc operating systems are designed around the interface hardware. This is where the jargon jungle is at its most impenetrable, and what you get is largely determined by how much you are prepared to pay. So make sure you get the facilities you really need.

Certain terms crop up time and time again. Each track on a disc usually has 10 sectors each holding 256 bytes. So, if storage is a prime consideration, 80 track double sided double density is going to give you 400K storage per drive.

Single versus double density is probably the most important factor. Double density operating systems are quite expensive, but they do give you twice as much room on the disc.

They do this by leaving out synch bits on the disc, and to cope with this, error checking must be more rigorous. One word of caution, you should find out what the formatted capacity of your system will be, unscrupulous dealers might try to tell you the unformatted capacity of the drive which is of no practical value at all.

Random access files are a must for serious



business applications. In a random access file, you can dig out the particular piece of information you need from a particular file and update it without loading and saving the whole file taking up precious time and memory. It is a sad fact that not many budget operating systems offer this facility.

It can, however, be fudged if a system supports serial access files where records can be read in order, and a new file created with the updated record — a poor second best.

Speed is not perhaps the most important consideration in a disc system, since most systems, with the glaring exception of the Commodore 1541 system are fast enough. However, hope is at hand, a new drive, the 1572 is promised. Speed is a function of both the speed of the drive and the efficiency of the DOS software. Whether this is important to you will depend on what you want a disc drive for. Try running two opposing systems side by side, ideally running the program you intend using most.

Operating system compatibility is another term often banded around. The Amstrad DD1 claims to be CP/M compatible, but will only run cut down versions of the standard packages. It claims to use IBM format files, but the IBM PC usually runs under a different operating system: MSDOS. Speaking of which, the new Enterprise disc system claims to run MSDOS and read IBM files, but this is rather pointless when the computer uses a Z-80 processor rather than the 8080 chip needed.

So treat all claims for "compatibility" with a good deal of caution. Another aspect of the *(continued on next page)*

Cumana's 3½ inch drives, the up-and-coming standard.

(continued from previous page)

same problem is that if you buy a DOS from a third party, it must be compatible with the standard operating system of the micro manufacturer.

Thus any proper disc system for the QL for instance must be compatible with microdrive commands or you won't be able to use the new drive to run the bundled software. Next on your list of questions should be how much of your micro's precious Ram is taken up by the disc DOS and does the DOS support a ram disc.

Pinches over 2K of Ram

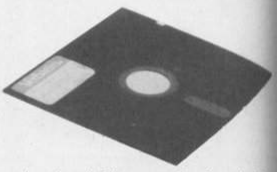
The Acorn DFS for the BBC micro pinches over 2K of Ram from the machine's already inadequate supply. Many Spectrum owners encounter problems with their interface 1's due to yanking them out every time they want to load up their favourite games, and a similar problem occurs to Amstrad owners.

A Ram disc is a data structure which sets aside an area of Ram which, in the eyes of the DOS, looks like a disc, with a directory and files, but with far quicker access times. A new idea is to incorporate Ram into the drive itself as in the new Challenger 3 from Opus, an idea which should become increasingly popular as memory prices continue to plummet.

Next we come to what is perhaps the guts of an DOS: the commands it offers, and their format. A bad example of syntax is the Sinclair system for interface 1. This is mainly due to the fact that you have to specify everything in an inflexible syntax, a good DOS will assume certain default values if the user fails to specify them. It should also be possible to specify files by "Wildcards". A file name normally has two parts, a name and an extension, wildcards allow a disc command to apply to all files with a certain name or extension, or those which start with a particular string.

Most disc systems can list the files on a disc, but ideally they should give more information than this. File size, type, and execution address are all helpful, although in some DOS, this information is provided by "help" or "info" commands. Obviously it must be possible to save blocks of memory, machine code programs, arrays, and variables as well as Basic.

Another point to watch is some systems limit the number of files you can have per side of the disc. If you intend using a lot of short files, this is obviously going to mean a lot of fumbling around with discs. Rename might seem a rather trivial command, but is vital if random access is not supported. This means that after an updated version of an old file has been created, the old file is erased and the new file renamed

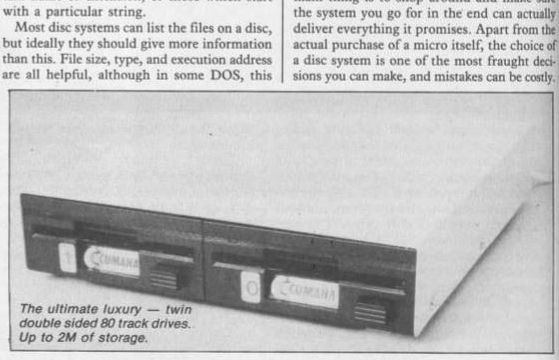


so that when the file next needs to be updated, the name will be the same. Compact tells the DOS to tidy up a disc.

After a time, gaps appear in a disc where programs have been deleted, this can decrease the amount of space available, compact crushes all the files up, freeing more space. Merge allows a large datafile to be created out of two smaller ones, with either one file in Ram, and the other on disc, or both programs on disc.

Make sure you shop around

It is obviously impossible to make any definitive recommendations about which system to go for, much depends on what you want and how much you are prepared to pay for it. The main thing is to shop around and make sure the system you go for in the end can actually deliver everything it promises. Apart from the actual purchase of a micro itself, the choice of a disc system is one of the most fraught decisions you can make, and mistakes can be costly.



The ultimate luxury — twin double sided 80 track drives. Up to 2M of storage.

MORE ELEPHANTS TO TRUST

ELEPHANT printer ribbons, head cleaning disks and computer cleaning kits are now added to the ELEPHANT family to provide you with a total computer supplies package. Together with ELEPHANT MEMORY SYSTEMS disks – certified 100% error free and problem free and guaranteed to meet or exceed every industry standard – ELEPHANT is now more than ever the trusted brand that gives you the best from your computer.

SPECTRUM

WHAT DO YOU GET if you cross a mouse with a telephone?

Good taste, the Animal Liberation Front, and the Official Secrets Act prevent me from telling you what I have seen in the Government's genetic engineering laboratories. All I can say is that Sinclair has come close with the weird numeric keypad which is the Spectrum 128's most distinctive feature.

A white 128 badge and an external aluminium heatsink — that looks like it might be a constructivist memorial to all those who perished in the computer wars — are the only other signs that this is a Spectrum Plus Plus. The 128 goes on sale in Spain now, four months before it hits these shores, but if you are thinking of popping over to the Costa Investronica to bring back a new Sinclair and an autumn tan don't bother.

Devil worship

If you wait till the U.K. launch next spring the 128 will cost around £150 whereas a Spanish Sinclair will set you back £100 more, including tax but not including a dictionary to translate error messages such as "Entero fuera de rango". So why is Sir Clive making good old blighty play second fiddle (or maybe that should be Fidel, since Investronica plans to export to Latin America) to Spain?

In short this summer's financial problems have forced Sinclair to sell his soul to the Devil, or rather Dixons. They agreed to take the mountainous drifts of surplus QLs and Spectrum Pluses off his hands if he agreed not to launch any new products here, which might damage their sales, until well after Christmas. But Sir Clive still desperately needed to show he had new products on the way. Hence the Spanish 128 deal.

A close inspection of the 128 shows that the Plus keyboard has survived intact apart from a few cosmetic changes made to satisfy new Spanish government standardisation regulations — the word video in black out of white to show true video and reversed on the inverse video key for instance. the Mic and Ear sockets have been moved from the back of the Plus to the left hand side next to a new RS-232 port to take the interfacing out of connecting up a printer, or modem to your Sinclair.

The RS-232 claims to double up as a MIDI music connector. But then what's in a name? Everyone knows that Sinclair is a corruption of St Clare — the patron saint of televisions — but no-one takes seriously Sir Flat Screen Clive's claim to be a major producer of bent tellies.

The whole point of MIDI is supposed to be a single standard to make interfacing music machines and micros easy so you can control instruments from the computer, modify pices of music and interpret them on screen. So the 128's non standard MIDI connector will have to be carefully examined on a full production machine before it can be recommended to musicians.

At the back the expansion slot is still where it was and all peripherals are still compatible except perhaps those that initialise system variables. An RGB/composite video port has now taken the place of the Mic and Ear sockets. Because the 128 incorporates an AY-38910 sound chip like the Amstrad et al the internal loudspeaker that was happy enough beeping and purring its way through the death march which every other Spectrum game features, shows its shortcomings. Now like other micros a new modulator feeds the TV socket sound as well as vision. At last turning up the noise is a simple matter of sliding up the TV volume button.

Search as you may you still will not find a joystick port on the 128 — an unforgivable omission — although some software houses will doubtless use the 128's numeric keypad as a touch pad controller.

This numeric keypad is a strange looking creature, like a calculator attached to the front of the computer by a curly telephone cable. If it had a track ball in the base to allow you to spin a pointer around on screen you would call it a mouse — but it doesn't so we'll call it a hamster. You can use this 15 button rodent as a simple calculator which displays the answers on the screen or for entering numeric data into programs — it might make typing in *Your Computer* listings a little less tiresome-or in 128 mode as a full screen editor. At last you can edit programs at will including renumbering sending the cursor straight to the area that needs correction.

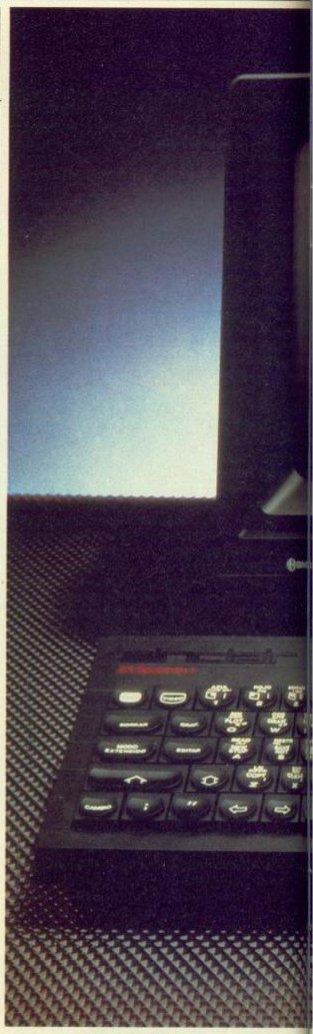
When you turn on the machine it defaults to 128 mode with a white or blue cursor instead of all the "Ks" and "Es" of the original. If you enter the command Spectrum it changes to 48K mode without losing the contents of memory but the only way to make it revert once again to 128 is by resetting — losing everything.

Basic programs can transfer from one mode to the other easily. If you Peek 80000 in 128 mode you will still get an out of range message because the additional 64K of memory is only accessible from machine code. The 32K Rom includes the old 16K Spectrum as well as the separate 128 operating system. The extra 64K Ram is paged in 16K blocks.

Memory maps are already in the hands of those software houses that have not had prototypes. Ocean is already demonstrating a 128 version of Match Day which takes advantage of the improved sound with cheering crowds, referee's whistle and so on. Supertest 128 is also near completion as well as the load-in-one version of the three part NeverEnding story

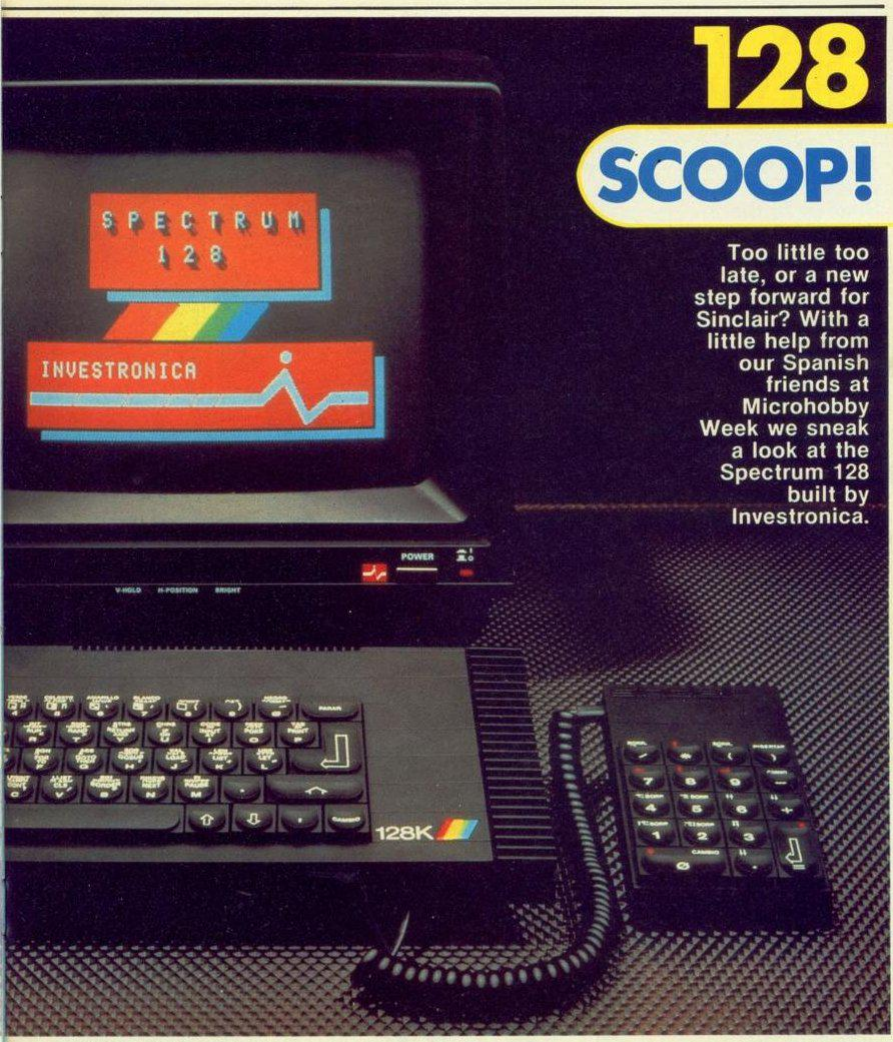
128 COMPARISONS

- ☐ Commodore 128. Better graphics, sound, software. £275.
- ☐ Amstrad 6128. Includes CP/M, monitor and disc. Less games. £300.
- ☐ Enterprise 128. Includes word processor, joystick. Almost no software. £250.
- ☐ Atari 130XE. Brilliant games but not as many as for Spectrum. Still tops for sound and vision. £170.



128 SCOOP!

Too little too late, or a new step forward for Sinclair? With a little help from our Spanish friends at Microhobby Week we sneak a look at the Spectrum 128 built by Investronica.



epic. Ocean's David Collier says he has had no loading problems with the Sinclair 128 unlike the Commodore 128 which has a variant of the 6502 processor "which is not as robust" as that in the 64. Ocean has now rewritten its fast loader to avoid crashing the Commodore 128.

The Sinclair 128 has the same ULA as the Plus so resolution, colours and screen management are all the same — 256 × 192, 8 colours. A Play command gives access to the new sound facilities. Text can be stored as separate pages by storing in the form of variables — A$, B$ and so on.

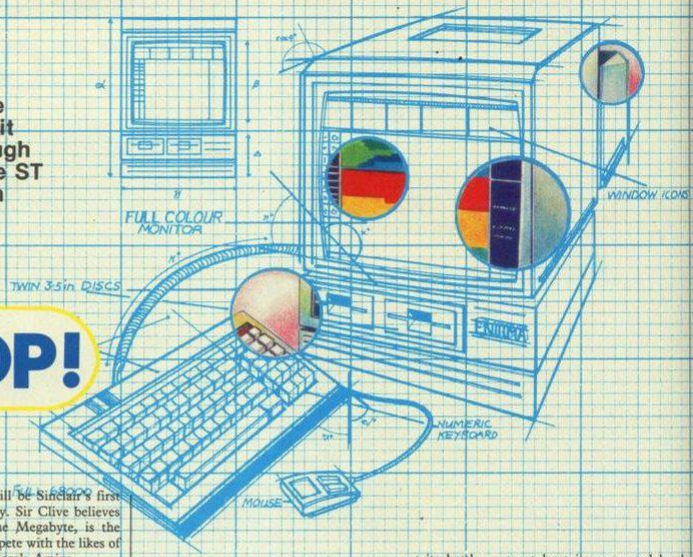
Spring offensive

Of course the machine we have seen is still a prototype, one which Domingo Gomez of Microhobby-Weekly magazine in Spain could only inspect at the headquarters of Investronica in Madrid but this is not a one-off special aimed only at Spain.

There may be some changes before it appears on the British market next spring but despite its faults the 128 looks like it will be a strong base model for Sinclair's new 1986 model range which will include the portable Pandora and the desk-top Enigma (see over page).

SINCLAIR ENIGMA

Next year's model from Sinclair is the Enigma. Can it be good enough to take on the ST and Amiga on their own ground?



SCOOP!

NEXT YEAR'S Enigma will be Sinclair's first Mega-machine — literally. Sir Clive believes that 1024K of Ram, one Megabyte, is the minimum needed to compete with the likes of Atari's ST and Commodore's Amiga.

He has also bowed to the inevitable and abandonned the Microdrives for a pair of built-in 3.5 inch disc drives. But the portable Spectrum-based Pandora also planned for early next year will still use Microdrives to keep down costs and weight. If Sinclair goes ahead with a portable QL that too may stay with the stringy floppies.

The Enigma is planned for launch in May '86 somewhere in the vague £500 — £1,000 price band. It will have a version of the Psion Quill, Abacus, Archive and Easel suite of programs but on Rom rather than the QL's Microdrive cartridges. The Enigma will also have a full Window, Icon, Mouse environment, probably Gem as used on the Apricot, since Digital Research has been having talks with Sinclair for some time and has publicly claimed that Gem could be ported straight across to the QL. The big question is whether Sinclair can compete with the Supermicros without going for a full 16-bit Motorola 68000 like the Amiga, Macintosh and ST rather than the cut-down 68008 in the QL.

The Enigma will be sold as a complete package; computer, software, two drives, mouse, colour monitor and printer. It might also develop with the addition of a phone and communications into a colour replacement for the Sinclair developed monochrome ICL One Per Desk — which because it was only black and white was known during its development as "Work Station Zebra".

Sinclair is also working on a "personal communicator" a £99 cigarette packet-sized portable phone that would allow you to make and take calls on the already established cellular radio network at any time or place. With the 128, Pandora and Enigma all lined up for launch in the first half of next year there would seem to be no place for the much-rumoured QL 2 as such. This now seems to have grown into the Enigma.

Sinclair's plans look ambitious at a time when the company is making 20 of its 120 staff redundant and such senior personnel as Nigel Searle and Robb Wilmot are being kicked off the Sinclair board. The company is also losing its bottle — or at least its converted bottle factory headquarters at Willis Road — where development work on new computers used to be concentrated and moving the entire operation to Milton Hall, country mansion of of Sinclair's Metalab.

Nigel Searle had been head of Sinclair's computer side before he was sent on a none too successful trip to America to boost Sinclair sales over there. Searle now loses his position on the board but stays on as Sinclair's top dog in the States. Robb Wilmot, Mr ICL, long-time associate of Sir Clive was brought in six months ago to develop the Sinclair/Catt wafer scale technology which promised to produce failsafe single-chip mega computers by the 1990's. Now Wilmot leaves the board and the company.

Can Sinclair's Enigma be ST, Amiga beater?

ADVENTURE INTERN

HOME OF THE HEROES

Paul Bond goes in search of adventure.

FINDING THE headquarters of Adventure International UK is a bit like solving an adventure in itself. The clue is the company sticker in the window of an otherwise nondescript warehouse in Birmingham 19.

"We don't mind being hard to find", says Mike Woodroffe, managing director and general co-ordinator of programmers and projects. "We're happy to talk on the phone, but we couldn't do with hordes of crazed adventure fanatics hanging about outside".

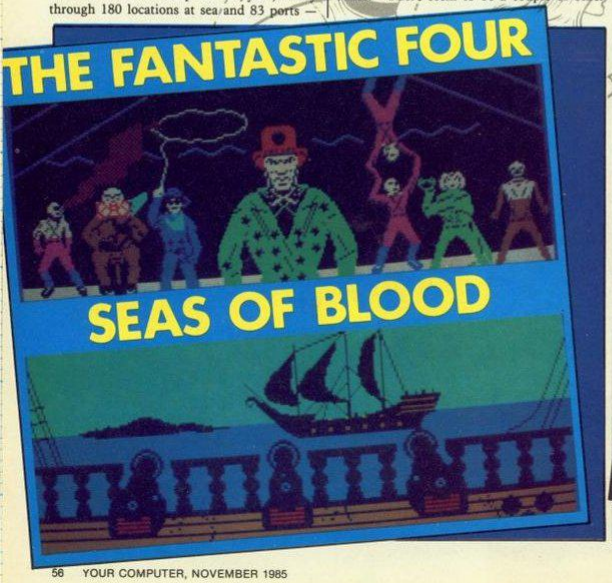
Life in the Handsworth area has been exciting enough without that: "Most of the rioting was only a mile away from the unit, but it affects the locals less than it affects people reading the national newspapers".

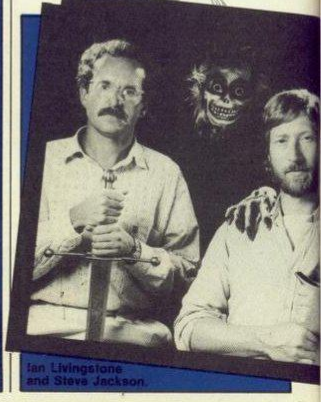
Seas of Blood, AI's next release, has nothing to do with urban unrest, but plunges us into a life on the ocean wave. Based on one of the Fighting Fantasy series of books by Steve Jackson and Ian Livingstone and published by Puffin, the game puts you in charge of a pirate ship. Together with your band of seasoned cutthroats you must scourge the Inland Sea, searching for gold and slaves and defeat your rival Abdul the Butcher in the race to become King of the Pirates. Setting off from Tak, the greatest den of thieves the world has ever known outside of a computer fair, you journey through 180 locations at sea and 83 ports — all with graphic illustration. There is a mini-adventure at every stop with 20 treasures to find all defended by gruesome monsters.

"We've taken the basic scenario of the book, changed some of the puzzles and objectives. The book and the game are different, but we've kept the scoring and stamina system. For instance, you don't just Fight Galley — you work out relative strengths to decide the outcome". Other FF games are planned — the next release looks like being Appointment with F.E.A.R. "The Fighting Fantasy books have sold over eight million copies — that's a lot of potential buyers".

A land-based outlaw is the subject of AI's Robin of Sherwood series of adventures, notable for their excellent graphics (see Quest Corner, this issue). Touchstones of Rhiannon's sequel, Seven Swords of Wayland, features the Hounds of Lucifer — sounds like Mike Woodroffe would like to unleash them on some nefarious characters in the industry; while the Robin Hood games are officially licensed and based on the books of Richard Carpenter, like the TV series. "There seem to be a couple of other Robin games about. We've sent copies of the ads to the licensing company. It's up to them — otherwise there's no point in our paying the licensing fee in the first place".

Adventure International also plans an assault on the arcade adventure market. Davy Jones' Locker is a joystick-based arcade adventure featuring Pegleg Bob, the lighthouse keeper. He must row to the lighthouse to rescue survivors of a shipwreck. In this sequence he is attacked by a whale, a swordfish and a shark which he has to beat off with his oars. Seagulls also fly about dropping unmentionable things on him. Next he runs across the rocks as the sea rises and waterspouts erupt around him. Now he must find the survivors and put them in a cave, while under attack from crabs. The final sequence is the wreck itself. He must row survivors to safety before being engulfed by a





Ian Livingstone and Steve Jackson.

NATIONAL

tidal wave.

This is a long way from American Adventure International's founding father's original vision. Does Scott Adams, the man who originally crammed Crowther and Woods' Colossal Adventure into a TRS-80, let the UK operation have a free hand?

"We're totally different companies, both from the ownership and the financial point of view. We have the licence for Scott Adams' product in the UK and Europe — at the time we got it Tricia (Mrs Woodroffe) and I were importing American software for the Atari 400/800. We did more business with Scott than anyone else."

It struck Mike Woodroffe that the American packaging was unnecessarily large: "We were paying to fly blocks of polystyrene over the Atlantic. Scott suggested that we set up our own duplication operation here — so Adventure International UK was born. We went over to Florida, spent the week in Disneyland — it was great".

Nigel Bamford, Michael Woodroffe and Patricia Woodroffe.

AI-UK also plan an arcade-style Gremlins game (not to mention a second Gremlins adventure proper). More Gremlins? Is this wise?

"Well, the first Gremlins by Brian Howarth, our ace programmer, outsold all our other stuff by double. It's been translated into Spanish and German with great success, and there's a French version on the way. A new Gremlin movie is due for release at the end of 1986."

The company implements American products like the forthcoming Quest Probe III game, featuring the Fantastic Four in the following way. Scott Adams writes the main story and Marvel comics in New York draw up the artwork. This is then sent to Ken McNair in Florida who codes it all onto an Apple. "Then we take the plot and the disc and convert it to Spectrum, Commodore and so on".

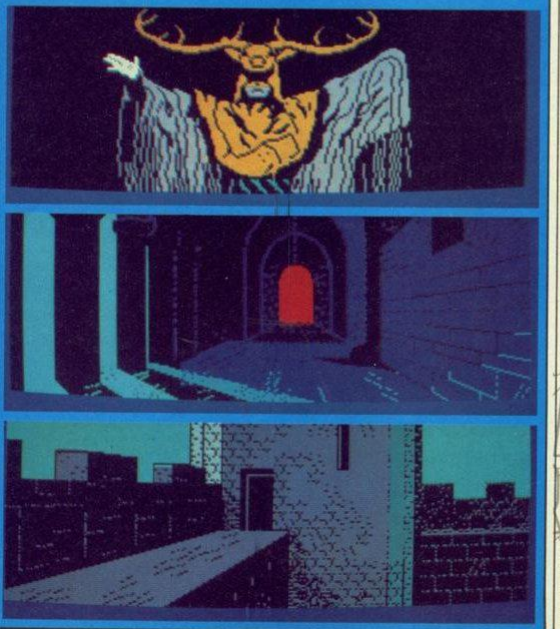
The Fantastic Four game stars the Thing and the Human Torch. It has a revolutionary new method of play for a Scott Adams game. You can switch indentities and there are far more Marvel characters featured than in recent games. "The US market is disc-based. Sometimes our cassette versions appear before they get the game over there". Anomalies are common in the adventure market. Adventurers buy strange things and the games can sit on the shelf for a long time. This puts off wholesalers.

"Would you believe, one chain store wouldn't take Robin of Sherwood — it has some of the best graphics I've seen in any computer game, not to mention publicity from the books and the TV series", says Woodroffe. The new series will star Sean Connery's son incidentally. "Only Centresoft carries our whole range."

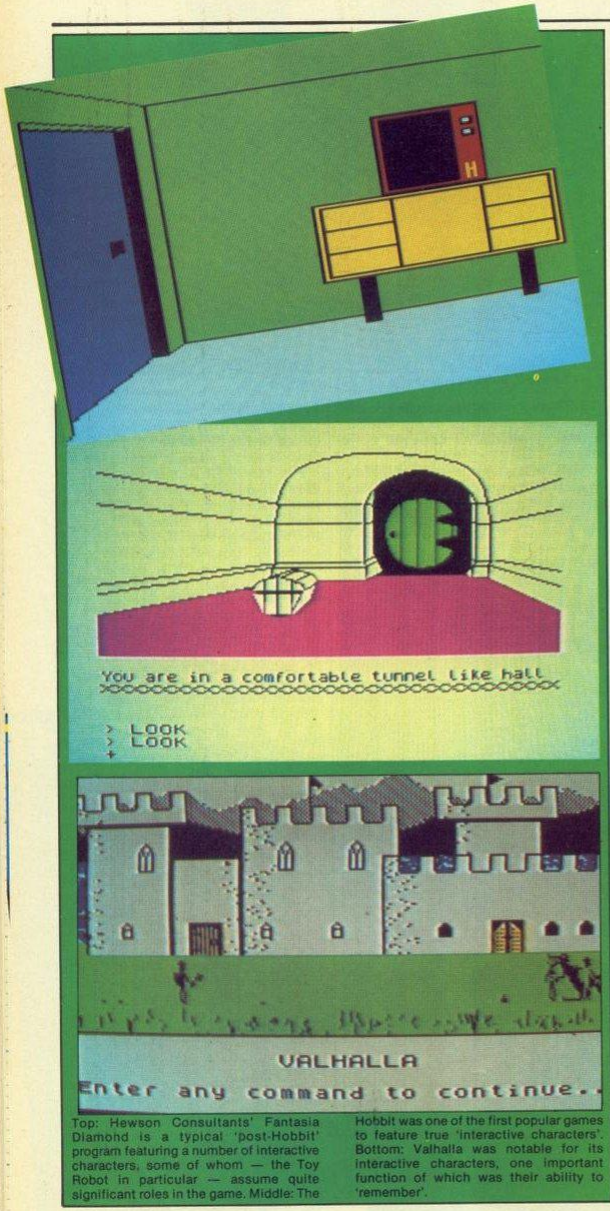
To solve this, AI created the concept of the Scott Adams Adventure Centre — basically dealers don't need to pay for units until after they've sold them. "We haven't pursued the concept very energetically — there are about 15 Adventure Centres at the moment — we plan on 80 or 100, but we'll get down to that after Christmas". One thing is sure, AI have plenty of new releases planned — apart from Fighting Fantasy, Robin of Sherwood, Gremlins and Quest Probe, they have the rights to Buckaroo Banzai *(who is he? — Ed)*.

Take Indiana Jones, mix a little popstar, throw in some super-hero and space-ace and you've got a Twentieth Century Fox movie awaiting release. "They've actually got the film in stock over here, but it's not being released yet". Could be another first for Adventure International. You've played the game, now see the movie.

ROBIN OF SHERWOOD



INTER
ADVENT



Top: Hewson Consultants' Fantasia Diamond is a typical 'post-Hobbit' program featuring a number of interactive characters, some of whom — the Toy Robot in particular — assume quite significant roles in the game. Middle: The Hobbit was one of the first popular games to feature true 'interactive characters'. Bottom: Valhalla was notable for its interactive characters, one important function of which was their ability to 'remember'.

PROGRAMMING TEXT-ONLY adventures in Basic is really quite easy, and lots of people tend to have a bash at it at some time during their programming careers. The funny thing is, though, that although an adventure is meant to be a program that interacts with the player, there's one feature that's almost always missing from a Basic adventure game — and that's interactive characters.

An interactive character is someone like Thorin in the Hobbit — a computer-controlled personality who appears to have a mind of his own. You may even, if he or she has been well-programmed, be able to sit down at the keyboard and have a limited conversation together. This particular feature can add enormously to any adventure game, be it of the simple home-brewed Basic variety, or a fully-fledged commercial game. Unfortunately, it's often either badly implemented or left out altogether.

The reasons why so few games have good characters in them may seem obvious. If you're going to include other people in the game, you're also going to have to include a whole load more data for messages — either speeches for them to deliver, or descriptions to tell the player what they're up to. On top of that, you'll also need to test hundreds of conditions to determine when these messages should be output. Obviously all this is going to take up loads of Ram, which you probably can't spare, because adventures tend to take up loads of Ram anyway.

Well, the good news is that there are ways of programming "intelligent characters" into your Basic adventure games, and these methods don't necessarily take up much space. You'll still need to set aside data storage areas for messages, but you can fit an awful lot of messages into, say, 3K — and that still leaves you with lots of room for other things like location descriptions and so on.

In this, and the two issues of *Your Computer* that follow, we're going to let you in on the secret of how it's done, and leave you with a type-in listing that will have characters interacting away to their hearts' content, or until you press the Escape key.

First, for those who may be a little unclear about the subject, let's define exactly what an interactive character is — and what it isn't. An interactive character should have three main attributes: the ability to move from location to location without help from the player; the ability to get, carry, and drop objects; awareness of his/her surroundings. These three main attributes will enable the character to play a significant role in the game. We've already mentioned Thorin as an example of such a character — another example would be one of the characters in Valhalla.

RACTIVE URE CHARACTERS

MAKE IT LIVE

James Hartley meets interesting people.

Some games do, of course, include characters but include them in such a way as not to qualify for the term "interactive". Such characters are really just objects, which are described in human terms. They can still be quite effective, but the point is that such "pseudo-characters" are 100 percent predictable. Once you've met "the old man by the crossroads", you know that you'll meet him again at the same point in the game every time you play.

If, however, the old man was a real interactive character, you might meet him in the pub, on the street, at the hotel, or even catch him stealing up behind you and pinching your purse — whereupon you can chase him and try and get it back.

All these actions can, in an adventure program, be set in motion by a routine which from now on we shall call the character handler. This is a routine that can accept the data for any character in the game, process it, decide what action (if any) to take — such as moving the character — and then return to the main adventure program. There are two sorts of character handler — asynchronous and synchronous. All this means that in the first case the routine is called independently of the player's actions.

In other words, whatever may be going on in the main program, a call is suddenly made to the character handler to update all the characters. Both the Hobbit and Valhalla use this technique — if you sit back and do nothing, you'll see the characters continue to act out their own pre-programmed lives, with perhaps a message such as "You wait . . ." or "Time passes . . ." flashing up on the screen every few seconds. This system is rather difficult to implement in Basic, unless you have an MSX or Amstrad computer provided with Basic interrupt commands.

An asynchronous system can appear more lifelike, because the pace of the game doesn't depend on the player, but a synchronous system is easier to program. Using this system, the character handler is called regularly at a certain point in the program — usually when the player enters a command. This is the system we shall be using here.

Before we actually get down to the nitty-gritty of bringing our characters to life, there are just two more possible attributes for characters that need to be mentioned. The first is speech — they should ideally be capable of addressing the player without being prompted, and — even better — answer back if spoken to.

The second is "history" — which means that a character should have some idea not just of what is going on around him/her, but also of what has happened previously. The best example of this is Valhalla, where characters like Thor took note of our actions and this influenced their behaviour later in the game.

Allowing the player to address characters does not just involve the character handler routine — it also involves the parser, that bit of your program that accepts input from the player. For this reason, we shall not be including it in our program, but you will find that the techniques illustrated will make it simple to implement in your own games. We will, however, be giving our characters something to say. So much for the background. Now, how's it done?

The first problem we have to solve is how to test conditions, because we're going to have to do it a lot and we need an efficient method. If you look at any book on programming Basic adventures you'll see that there are lines upon lines of If statements, since this is the easiest way of testing a condition in Basic. Here are a couple of examples:

```
IF (the player is in the dungeon) AND
IF (the rats are hungry) THEN PRINT
(Aaaaaagh!!!)
IF (the player is in the dungeon) AND
IF (the rats are dead) AND IF (the
player is hungry) THEN PRINT
(Mmmmm! Revenge is sweet!)
IF (the player is not in the dungeon)
THEN PRINT (Freedom is slavery)
and so on . . .
```

This is all very well, but you could soon find yourself writing a line full of Ifs for every message you want to print on the screen. However, the good news is that we can do without Ifs altogether! The first step is to look at the problem in a completely different way. Let's take the example above and represent the decision-making process as a "tree" — see diagram 1.

A structure like this is called a decision tree. It is composed of different nodes (the rectangles) connected. The nodes fall into two types —

(continued on next page)

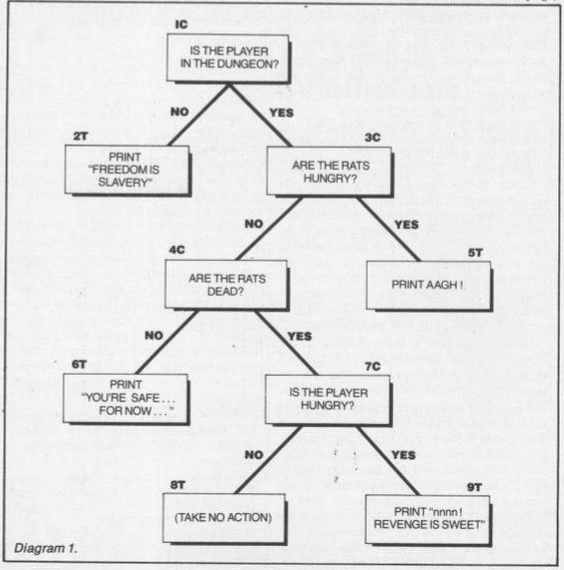


Diagram 1.

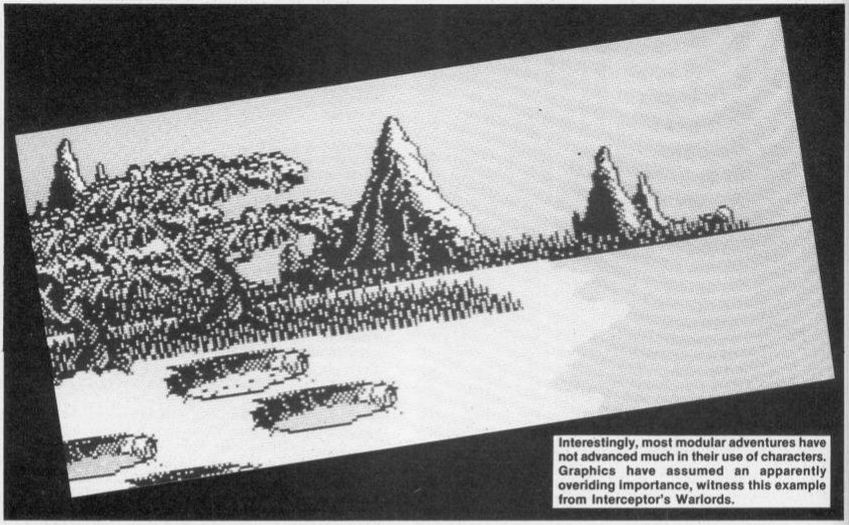

Interestingly, most modular adventures have not advanced much in their use of characters. Graphics have assumed an apparently overiding importance, witness this example from Interceptor's Warlords.

(continued from previous page)

choice nodes, which test a condition (such as Is the player in the dungeon?") and terminal nodes, which do not test a condition and have no further branches leading from them. In this diagram, each node has been numbered and given a letter corresponding to its type — C for choice, and T for terminal. The conditions tested correspond to those in our If examples above, though you should be able to see that we have made a simple addition, which could be expressed as:

```
If (the players is in the dungeon) AND
IF (the rats are not hungry) AND IF (the
rats are not dead) THEN PRINT
(You're safe . . . for now)
```

Instead of executing a load of If statements, we can enter a tree like this into a Basic program as a set of data, and then traverse it using a short routine. Traversing a tree means starting at the top and working our way down along the different branches until we arrive at the right terminal code, since when we arrive at one of these we know that we have reached the end of the decision process, and can take whatever action is indicated by that particular node.

Let's look at how a Basic program might traverse our rats-in-the-dungeon tree. In order to do this, all our Basic program needs to know is what type each node is — terminal or choice. If it's a choice node, the program will also need to know what condition is to be tested, and both which node to jump to if the condition is true, and which to jump to if the condition is false.

For the moment, we'll assume that our player is in the dungeon and the rats are alive but not hungry. Let's see what happens . . . Starting at node one, the program will first check to see if the node is a choice or terminal node. It's a choice node, so next we check the associated condition, and find that it is true.

The program looks up the data for node 1, result true, and finds that the new node to jump to is node 3. The process is repeated and the program jumps to the node associated with node 3, result false. Again the process is repeated for node 4, with the program ending up at node 6. This is a terminal node, so the program stops here and prints the message "You're safe . . . for now".

The tree we've just shown is very simple, but trees like this can develop into enormous baobabs of programming complexity, testing hundreds of different conditions, but still — remarkably — taking up very little Ram. The secret is in the way such a structure can be translated into a Basic program, and this is very easy. The first step is to store all the conditions to be tested in an array, so that we can refer to them by numbers.

So, for example, the condition "Is the player in the dungeon?", which like all conditions can evaluate either to zero (false) or non-zero (true), will have its value stored in conditionarray(1); the value of "Are the rats hungry?" will be stored in conditionarray(2), and so on.

All we need to do then is set up an array holding the information for each node. Let's suppose that this array is called the t array. For our example tree, we should Dimension it as follows:

```
DIM t(9,4)
```

The first subscript, 9, is the number of nodes. The second subscript, 4, is the number of different data items we need to store for each node — these are:

(1) node type — choice (indicated by a 0) or terminal (indicated by a 1)
(2) for a choice node, the number of the condition to be tested
(3) for a choice node, the node to branch to if the condition is false
(4) for a choice node, the node to branch to if the condition is true

In the case of terminal nodes, elements 2 and 3 are set to zero, and element 4 holds a number used to select the relevant message from a data store.

As an example, then, the data for node one could be read into the t array from a Data statement as follows:

```
10 FOR n = 1 to 4: READ t(1,n): NEXT
20 DATA 0,1,2,3
```

We could extend this to read data for each of the nine nodes into our array.

Now comes the magic — we can traverse the tree simply by setting a variable 'nodenumber' to one and then using the following routine:

```
IF t(nodenumber,1) = 1 THEN (exit tree
because we've reached a terminal
node) ELSE
nodenumber = t(nodenumber,t
(nodenumber,2) + 3): GOTO (beginning
of line and do again)
```

The first part of the routine simply checks to see if we've reached a terminal node and, if so, jumps out of the traversal process. All you really need to pay attention to is the second part, and the way in which the new node number is assigned to the variable nodenumber.

This is done by getting the relevant record for the current node, and selecting from the array the appropriate node number to branch to next by adding the value of the condition number held in t(n,2) to the number 3, giving us either t(n,3) (if the condition was false) or t(n,4) (if it was true). The routine simply calls itself repeatedly until it finds a terminal node and exits.

In next month's issue, we'll show this technique in action, and begin the process of bringing our characters to life. ■

Self Adhesive Cassette & Disk Labels

★ 3" & 3½" COMPACT DISK LABELS
★ SINCLAIR MICRODRIVE LABELS
(ON TRACTOR FEED BACKING PAPER)
★ 24 HOUR SERVICE FROM STOCK

CASSETTE LABELS ON A4 SHEETS - White only, suitable for printing by offset litho or photocopying: 100 labels - £3.50; 200 - £6.00; 500 - £12.00; 1000 -£21.85

CASSETTE LABELS IN ROLLS - Complete with tractor feed backing paper for overprinting by computer printer. Available white or tinted blue, pink, green, orange, yellow, grey, peach, or cream. Minimum order 500 labels.
WHITE: 500 - £14.66; 1000 - £20.70; TINTED: 500 - £16.90; 1000 - £24.15

DISK LABELS - All labels are on tractor feed rolls with tints as above.
95 x 36 mm. WHITE: 500 - £12.75; 1000 - £17.75; TINTED: 500 -£15.20; 1000 - £24.65

3" & 3½" COMPACT DISK LABELS - 70 x 69 mm. white or tints as above.
WHITE: 500 - £15.55; 1000 -£22.05; TINTED: 500 - £21.35; 1000 - £31.05

SINCLAIR MICRODRIVE LABELS - Side label 28 x 19 mm., Spine label 31 x 5 mm. Labels laid out side by side on tractor feed backing paper.
WHITE: 1000 - £12.15; 2000 -£18.72; TINTED: 1000 - £16.64; 2000 - £32.52

ADVANCED Z80 MACHINE CODE

A new authoritative guide, for those who want to improve their Z80 machine code programming skills to a genuinely professional level, has just been published by Interface, at £12.95.

If you already know the fundamentals of programming in Z80 machine code, and now want to expand your skills, to tackle advanced, serious and practical program development, then this is the book for you.

Advanced Z80 Machine Code Programming, by William Nitschke, fills a serious gap in the literature on programming the Z80. Rather than dealing with the elementary concepts of Z80 architecture, this new book discusses the material you now need to know to advance your skills. The core of the book looks at popular programming applications. Starting with the basics of organising information, generating arrays and tables, block moving, shifting and erasing, string manipulation, data compression and command tables, it moves on to advanced applications like word and sentence decoding. Games programming is then examined in detail, including three-dimensional maze generation, animated graphics and the development and coding of arcade games, and the synthesis of speech and sound effects. There is also a complete set of 'undocumented' Z80 instructions.

You can buy *Advanced Z80 Machine Code Programming* by William Nitschke (ISBN 0 907563 90 2) at £12.95 from most book and computer stores, or direct from the publisher, post free, at:

Interface Publications Ltd., Dept YC, 9-11 Kensington High Street, London W8 5NP
(Trade only: WHSD Leicester)

POOLSWINNER

THE ULTIMATE POOLS PREDICTION PROGRAM

- **MASSIVE DATABASE** Poolswinner is a sophisticated Pools prediction aid. It comes complete with the largest database available – 22000 matches over 10 years. The database updates automatically as results come in.
- **PREDICTS** Not just SCOREDRAWS, but AWAYS, HOMES and NO SCORES.
- **SUCCESSFUL** SELEC guarantee that Poolswinner performs significantly better than chance.
- **ADAPTABLE** Probabilities are given on every fixture – choose as many selections as you need for your bet. The precise prediction formula can be set by the user – you can develop and test your own unique method.

Boxed, with detailed instruction booklet

- **SIMPLE DATA ENTRY** All team names are in the program. Simply type in the reference numbers from the screen. Or use FIXGEN to produce fixture list automatically (see below).
- **DISC/MICRODRIVE COMPATIBLE** Tapes supplied with conversion instructions.
- **PRINTER SUPPORT** Full hard copy printout of data if you have a printer.

AVAILABLE FOR Spectrum (48K), Commodore 64, VIC 20 (+16K), AMSTRAD, BBC B, Atari (48K), ZX81 (16K), Dragon, Apple II, ELECTRON

PRICE £15.00 (all inclusive)

NOW AVAILABLE

FIXGEN 85/6 AT LAST: No more struggling for hours to get the fixture list into the computer. FIXGEN has been programmed with all English and Scottish fixtures for 1985/6. Simply type in the date, and the full fixture list is generated in seconds. Fully compatible with Poolswinner.
POOLSWINNER with FIXGEN £16.50 (all inclusive)

COURSEWINNER V3
THE PUNTERS COMPUTER PROGRAM

NOT JUST A TIPSTER PROGRAM, Coursewinner V3 can be used by experts and occasional punters alike. You can develop and test your own unique winning system by adjusting the analysis formula, or use the program in simple mode. Coursewinner V3 uses statistical analysis of major factors including past form, speed ratings, course statistics, prize money, weight, going, trainer and jockey form etc. etc. It outputs most likely winners, good long odds bets, forecasts, tricasts etc. The database includes vital course statistics for all British courses. You can update the database – never goes out of date.

AVAILABLE FOR Spectrum (48K), Commodore 64, BBC (B), AMSTRAD, Atari (48K), Apple II

PRICE £15.00 (all inclusive) includes Flat AND National Hunt versions.

The crystal ball

Windam Classics is the title of a new series of text and graphics adventures based on famous children's books. The series is being marketed on disc for Commodore 64 owners by W.H. Smith Distributers.

There are two types of game. Alice in Wonderland — reviewed this issue — and Below the Root — based on the Green-Sky trilogy — are mainly animated graphics with added text. The more traditional type of adventure can be found in Swiss Family Robinson where text plays a greater role.

Others planned for release include Treasure Island, Robin Hood and The Wizard of Oz. The Worm in Paradise, Level 9's sequel to Snowball and Return to Eden, should be with us any time now.

A helping hand

Dean Cooper of Dudley has found Scott Adams' Secret Mission — formerly Mission Impossible — a trifle tough.

Can't get the yellow key?

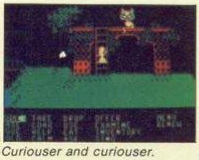
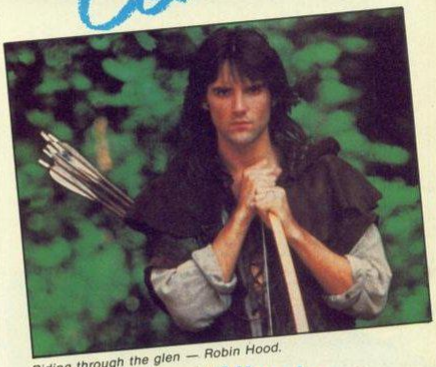
WOLL EYNE HTDE RHSU
PRIA HCNI
Where's the blue key?
POME HTEK AHS



Curiouser and curiouser.

QUEST *Corner*

Our man with the brass lamp and the key to a thousand mysteries sheds light on new adventure programs. Lost? Never fear, Hugo North is here.



Riding through the glen — Robin Hood.

Robin of Sherwood

- *Spectrum/CBM-64/Amstrad*
- *Adventure International*
- *£9.95*

IN THE DAYS of the Lion spawned of Devil's Brood, the Hooded Man shall come to the forest. There he will meet Herne the Hunter, Lord of the Trees, and be his son and do his bidding. The powers of Light and Darkness shall be strong within him. And the guilty shall tremble.

Or, to use prose of a slightly less purple hue, Robin Hood and his merry men are up and about again and all set to duff up the baddies in this new text and graphics adventure.

If the mention of the aforesaid Hooded Man and Herne the Hunter twanged your memory's bowstring, that's probably because this adventure is based on the popular TV series and has been officially licensed from Goldcrest.

Mike Woodroffe has joined forces with programmer Brian Howarth and graphics supremo Teoman Irmak to produce an adventure that is both mentally challenging and visually stirring. If you're a BBC or Electron owner, you'll have to be content with a text-only version at the lower price of £7.95.

Like many of Adventure International's recent releases — Gremlins, Hulk, Spiderman, Sorcerer of Claymorque Castle, etc — Robin of Sherwood boasts superb graphics, the best you'll see in any adventure. The only others I've seen that come near to A.I's standard are those by Terry Greer of Interceptor but you don't get many pics per adventure with theirs.

Subtitled Touchstones of Rhiannon, the adventure not only casts you as the bold Robin but also casts you straight into a dungeon at the start of the game. Although the opening parallels one of the TV scripts, you may find it a shade difficult to escape from this early predicament. **Despair not — A.I. have thought** fully given some coded clues on the packaging to get you out of the pit. Before you rush off to Sherwood Forest, you might care to explore the castle. The Lady Marion's in there somewhere and it might pay you to chat her up before you belt off.

Once in the Greenwood, you're sure to meet up with Herne The Hunter, he of the funny headgear. Hatrack-head will tell you that your quest is to find the six Touchstones of Rhiannon and return them home.

Sherwood Forest sure is a large place and you're likely to get lost quite quickly. Keep plugging away though and you'll be rewarded with a stunning animated picture of a waterfall. Elsewhere, you might be lucky enough to stumble across a bewitched John Little, Kirklees Abbey and a grange.

Robin of Sherwood is a visual treat coupled with a testing mission.

Alice in Wonderland

- *Commodore 64*
- *Windham Classics*
- *Disc £14.95*

CURIOUSER AND curiouser! Windham have combined traditional interactive text with command menus, graphics, sound and elements of arcade action.

The result is a charming adventure, offering something for the whole family. The game is based on the Alice books with some new ideas and characters added. You guide an animated Alice through some 250 screens, meeting over 60 different characters.

With the aid of a joystick, Alice can be made to walk, run, climb, crawl, stand, swim, and jump.

Part of the screen is reserved for entering commands and for receiving textual information. However, you don't have to type a thing — all input is done by means of option menus controlled by your joystick.

Most of the famous characters are there — all are animated — including the Cheshire Cat, the Mad Hatter, the March Hare, the Walrus — but no carpenter — and the White Rabbit.

Alice is a large, engaging and often humorous game. While it is undoubtedly aimed at younger children, many adults will enjoy this entertaining revisit to Wonderland.

```

KUNG FU MASTER is fairly unusual as magazine listings go, as it allows either Electron or BBC users to type in the program as it stands and the program itself detects which machine it is running on and makes any necessary changes to the program automatically. This is achieved by reading the value of the Inkey-256 command.

The game is standard Karate-style where each player can execute a certain number of moves, in this case 10, in order to attack his opponent or defend himself. The unusual thing about this game is the size and quality of the graphics; each player being 64 pixels or eight characters high. Such large characters would normally take a large chunk out of the already limited memory and would also result in a huge amount of data which would have to be typed in by the user.

To get around this problem I have used a simple but still effective compression technique; each character is stored in miniature form, in this case four characters high, and then this is expanded up to the full eight characters by the printing routine.

To implement the moves you must use the following combinations of control keys:

Listing 2.

KUNG FU MASTER

Forward/Backward/Jump — self explanatory.
Punch — Forward and up.
Face shove — Jump and down.
High kick — Backward and up.
Mid kick — Backward and down.
Lower Mid Kick — Jump and up.
Jab Kick — Forward and down.
Block — Forward and down.

The actual keys for the players are:

Key Function	Player 1	Player 2
Forward	'Z'	','
Backward	shift	'.'
Jump	'F'	Return
Down	'X'	'?'
Up	'D'	':'

All four listings should be typed in and saved one after the other on the same cassette. If your cassette recorder has no motor control then allow quite a large gap between programs.

If you do not want to type in the game but do wish to play it simply send me a blank cassette and large s.a.e. and I will record the game for you free of charge. Brian Lewis, 47 Highlands Road, Bridgnorth, Shropshire WV16 5BZ. ■

Listing 3.

"My two sun spots"

1. Souls of Darkon
by Taskset
Sorry about the summer – a wee bit disappointing I'm afraid, but here's something to cheer you up. A super game sizzling with excitement!

2. Scooby Doo
by Elite
This game is full of ghosties and ghoulies and mysterious happenings. Good old Scooby is back and so is my dear friend Mrs McUrioch. (Her name is almost as difficult as mine!)

"Press the magic button and the picture changes"

GEOFF CAPES STRONG MAN

by Martech

Let's hear it for Geoff Capes. The World's strongest man. Did you know he is World Highland Games Champion too? Can you beat that? Well, with this game you can try. Six major challenges in all, and always a blue sky above so no chance of rain stopping play. Versions for most machines.

Cassette **£7.95 and £8.95**
Disk **£14.95**

ARNHEM

by CCS

1944 all over again, and what's this – a strong front advancing over Holland? Um, yes, of course it's the Allies attacking the Germans and they need your help. With bridges to capture and strategy to work out, it's as complicated as weather forecasting – but much more fun! (Sorry Michael).

Spectrum 48K **£8.95**
Amstrad **£9.95**

STRIKE FORCE HARRIER

by Mirrorsoft

What's faster than a hurricane and more devastating than a tornado? You've got it in one. Strike Force Harrier – the flight simulator that streaks through the skies like lightning. You are loaded with bombs to destroy the enemy – but watch out for the clouds of enemy fighters on the horizon.

BBC B and Electron **£9.95**

MARSPORT

by Gargoyle Games

This large dome on your screens is a force sphere protecting the Earth from attack by Sept Warriors. It's a wee bit scary as the sphere is weakening and the strengthening plans are in an occupied town. All in all a gloomy outlook. Can you change that?

Spectrum 48K and Amstrad **£9.95**

THORN EMI Computer Software
International Micro Software Division

"Look what my charts are showing"

HIGHWAY ENCOUNTER

by Vortex

Temperatures are rising fast. But it's not a heatwave, I'm afraid. The Aliens have landed. To save the globe from domination you have to activate the 5 Vortons and the deadly Lasertron. Dodging hailstorms of bullets you must boldly go forth to save the planet. (I think I'd rather stay at the Met office.)

Spectrum 48K and Amstrad **£7.95**

SCOOBY DOO

by Elite

The team of top sleuths is back. This lot could sniff out a sunbeam! Stunning graphics and super smooth action give this game a touch of class.

Spectrum 48K **£6.95**
Commodore 64 **£7.95**
Amstrad **£8.95**

WORLD CUP

by Arctic Computing

This league table reads MUCH better than my round the world temperature chart. But then top teams are involved, and you get the chance to pick the players and score the goals. Och, what could be fairer than that, ref?

Spectrum and C16 **£6.95**
Commodore 64 and Amstrad **£7.95**

hs for Autumn'

COMPUTER HITS

by Beau Jolly

A summary chart of all that's the best in computer games. But on this chart not a depression in sight! Every one is guaranteed to keep you smiling rain or shine. There are sports, simulations, arcade and adventures. Oh, and yes, I almost forgot, a version for most machines.

10 games **£9.95**
6 games **£6.95**

GANDALF

by Tymac

Two great games now on Spectrum. Gandalf – a man after my own heart – throws thunderbolts from his fingertips.

FLYER FOX

by Tymac

It's not raindrops falling on your head but fireballs from a Mig fighter.

Spectrum 48K Each game **£7.95**

"Super plays for rainy days"

Souls of DARKON

by Taskset

Not for the faint of heart this one. You must venture beyond the sun and through the gof – oops sorry fog (no, not to Lanzarote) to Megron, where the trick is to free the people from the curse of Darkon. Oh dear, quite a challange, but YOU can succeed.

Amstrad **£8.90**

Old Scores

by Global Software

Solving this is like finding a snowflake in July (or deciphering one of my maps). Private Investigators will love it, and if you have never been lost around London's South Bank, here's your chance. Solve the mystery, explore the theatres, and become famous!

Spectrum 48K **£6.95**
Amstrad and Commodore 64 **£7.95**

Graham Gooch's

TEST CRICKET

by Audiogenic

A super game for all seasons. Complete with googlies, silly mid-offs, authentic scoreboards and starplayers – relive the highlights of summer!

Commodore 64 (Cassette) **£9.95**
Commodore 64 (Disk) **£11.95**

Paintbox

by Audiogenic

The graphics package which gives you much more than squiggly lines and cloud shapes. It has everything you need to produce high resolution pictures. Do you think the beeb would be interested?

Spectrum, Commodore 64 and 16 **£9.95**

The Secret DIARY OF ADRIAN MOLE aged 13¾

by Mosaic

It's no fun being me. What with the sun turning to snow overnight and always having to look on the bright side. Now if I was a budding intellectual and poet like Adrian all my problems could be turned into great fun. And maybe they'd make me into a game too. (Well, I can dream.)

Versions for most machines.

Cassette **£9.95**
Disk **£12.95**

"Games to bring you Winter cheer"

BLADE RUNNER

by CRL

Gosh, here's a chance to be a bounty hunter *and* save the world. Scattered showers of Replidroids have run amok. These human look-alikes have to be pinpointed, tracked down and 'retired' if the outlook is to be at all sunny.

Commodore 64 **£8.95**

Screen Shot

GRAPHICS PACK

by Dorling Kindersley

Are you interested in really good value? I am too, and this books plus software pack has loads of routines for creating lovely graphics. There are over 200 sprite designs alone! Gosh, it's um well unbelievable – top class graphics, super fast speeds and hi-res reults.

Spectrum, Commodore 64 and Spectrum+ **£15.95**

Win

SPOT THIS MONTH'S MYSTERY MICROGAMER AND WIN A FANTASTIC PRIZE. TEN 2-PACK PROGRAM PRIZES MUST BE WON PLUS SINGLE GAME PRIZES FOR THE FIRST 100 RUNNERS UP.

If you think you know the answer, send this coupon to us, no later than 14 November 1985. The first ten correct entries will each receive SCOOBY DOO and SOULS OF DARKON. 100 runners up will each receive a super game for their machine type.

I say the Mystery Microgamer is: _____

Mary Dolan, Preston
Amil K Seth, Wantage

Last month's mystery Microgamer was Tracy Ullman. 10 prizes are on the way.

All games featured are available from Laskys, WH Smith and other good software stores.

KEY CHOICES

Choosing electronic instruments can be as confusing to the newcomer from the world of computing as choosing a computer is for the musician.

MIDI-equipped instruments and accessories come in a variety of shapes and sizes, with price-tags from under £200 to £40,000 or more.

The first instrument you are likely to want is a synthesiser. Two years ago you would probablay have had to spend at least £1,000 for a MIDI-equipped synth. Now you have a choice of models retailing at under £500.

Of these, probably the most attractive from the computer user's point of view is Casio's £345 CZ-101 synthesiser.

The CZ-101 is the smallest of a family of fully programmable digital synthesisers, but the sounds it produces are as powerful as those of synthesisers many times its price. The one noticeable compromise is that its keyboard is smaller than standard, but for £150 more you can get the electronically identical CZ-1000 with a full-size keyboard.

One particular attraction of the CZ-101 for the computer user is that it is "multi-timbral". What this means is that in addition to its normal eight-note polyphonic operation (with each note producing a similar sound at a different pitch), it can also operate as four monophonic synthesisers, each with its own sound, responding to different MIDI channels.

Another synthesiser of interest to the computer user is Siel's £399 Expander 80. This is a synthesiser without a keyboard which can only be driven by MIDI signals.

Siel have also just introduced a range of keyboard instruments with preset voices, designed for connection to computers. The smallest of these, the £169 MK370 includes a non-standard interface to link it to the Commodore 64/128 computers. The more powerful £250 MK490 and £325 MK610 instruments also include RS-232 interfaces. Siel also markets a £26 RS-232-to-MIDI converter.

If your budget is big enough, you might look at the recently-introduced DX21 synthesiser from Yamaha. This is a £699 brother for the £1,299 DX-7 synthesiser.

Once you have a synthesiser, the next MIDI instrument on your shopping list will probably be a drum machine. Yamaha could help here as well with its £250 RX-21, a rhythmic companion for the DX-21. Although it has fewer drum sounds and facilities than most other drum machines it is also less than half the price.

Even if you play an instrument other than a keyboard, MIDI can still help you. For example, there are several devices for converting a guitarist's actions into MIDI signals although, at present, these cost well over £1,000.

More affordable is an ingenious Canadian development called the Pitchrider which analyses musical sounds such as those produced by the human voice or woodwind instruments and translates these into MIDI codes. This device, expected to retail for around £200, could open up the world of MIDI to musicians who have previously felt excluded because their instruments operate without an electrical supply.

IF – OR, IN the case of Spectrum owners, when – you tire of the music-making capabilities of your micro's internal sound system, don't despair. There are still two avenues you can explore with your micro to extend your musical horizons.

The first of these is to hook an external sound-making device onto your micro. The second is to use the computer's memory to store a digitised version of a real sound which can later be regurgitated in a more-or-less musical fashion. This is known as sampling.

The former option can be divided further into dedicated micro add-ons such as Acorn's Music 500, Siel's Sound Buggy and Commodore's Music Expander and the stand-alone music synthesisers and electronic percussion instruments, commonly known as drum machines, that are a vital ingredient in much of today's music.

The modern synthesiser or drum machine is essentially a computer dedicated to making musical sounds. All that is needed to allow your computer to converse with an electronic instrument is an interface and communication protocol. This exists in the form of the Musical Instrument Digital Interface — MIDI, for short.

MIDI emerged a few years ago when musical instrument manufacturers got together to draw up a standard way for their instruments to talk to one another. As we explained last year — *Your Computer*, September 1984 — MIDI is a serial link operating at 31.25kBaud — more than 60 per cent faster than the RS-232 — along which digitised information about the operations of electronic instruments is transmitted.

At its most basic level, this data defines which notes are being played, when they start and stop, and, sometimes, other factors such as the force with which they are struck and held down. These last two parameters — velocity and pressure sensitivity — can be used by some synthesisers to modify the sound produced thus giving the player more musical expression.

MIDI can also be used to transmit information about the parameter values used to define particular sounds or "voices".

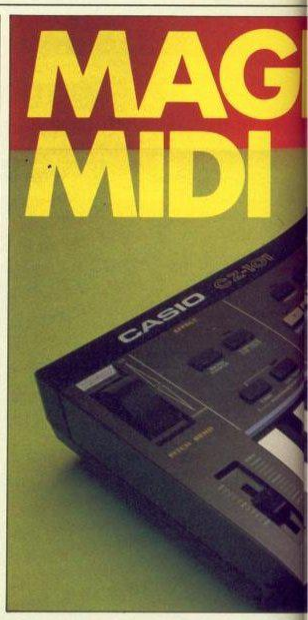
MIDI information is transmitted on up to 16 software "channels" each controlling one or more instruments. This allows complex multi-part musical arrangements to be performed in real time.

Physically, MIDI manifests itself as two or more five-pin DIN sockets without which the modern electronic musical instrument would be incomplete. Separate MIDI In and Out sockets are used to transfer data to and from an instrument, and many instruments have a third, Thru, socket which passes the information fed into the In socket on to other instruments.

Most musicians probably either ignore the MIDI sockets or use them only to link one synthesiser with others. MIDI allows synths with differing or complementary voices to be linked together and played simultaneously from a single keyboard, thus providing a fuller, more interesting sound.

But MIDI also opens up exciting possibilities for linking electronic instruments with computers. Using a simple interface costing as little as £20 and suitable software, your computer can start to talk to synthesisers and drum machines. The resulting conversations

MAG
MIDI



can be mind-blowing.

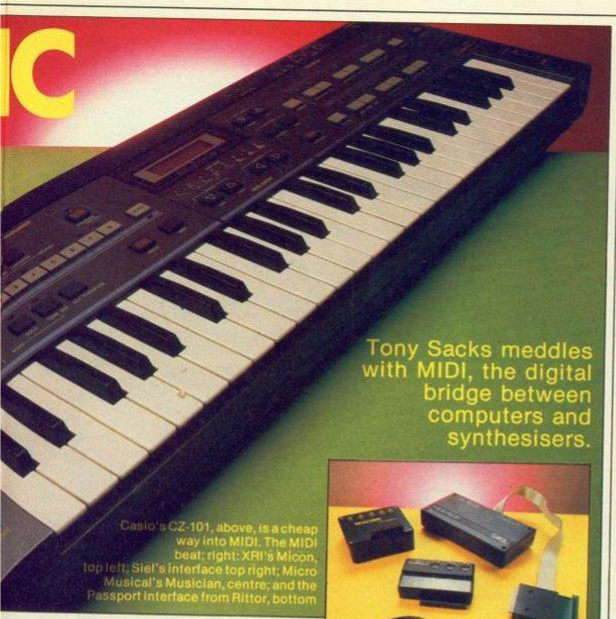
Already there are more than 20 MIDI packages on the UK market and the numbers are growing by the month. Software writers have so far concentrated on the Spectrum, BBC and particularly the Commodore 64 machines, but Amstrad and MSX owners will soon be able to experiment with MIDI when interfaces become available for their machines.

To date, most MIDI software packages have fallen into one of three categories; real-time recording; step-time recording; and voice editing and storage for specific synthesisers.

In all cases the hardware set-up is similar. A MIDI interface is plugged into the appropriate orifice of the micro and is, in turn, connected to a "master" electronic instrument by a pair of DIN leads, one for each direction of MIDI data flow.

In real-time recording, the micro is used to

MIDI Sophistication from Joreth.



Tony Sacks meddles with MIDI, the digital bridge between computers and synthesisers.

Casio's CZ-101, above, is a cheap way into MIDI. The MIDI beat; right: XRI's Micon, top left; Siel's interface top right; Micro Musical's Musician, centre; and the Passport interface from Rittor, bottom

simulate the operations of a tape-recorder — usually multi-track — except that instead of audio signals, MIDI information is recorded.

As the instrument is played, it transmits a stream of MIDI data which can be stored on one "track" of the simulated recorder. This track can then be "played back", retransmitting the MIDI signals to drive the same — or other — synthesisers while the musician records accompaniments on other tracks. Software packages with up to 16 such tracks are available.

Each track can be assigned to a different MIDI channel and can thus play separate parts on up to 16 instruments or groups of instruments simultaneously. Although it is dangerous to take the tape recorder analogy too far, it is worth remembering that a 16-channel tape machine could cost tens of thousands of pounds and still not offer all the editing facilities of a good MIDI real-time recorder.

For example, some real-time recorders offer a facility unique to MIDI, known as "autocorrect" or "quantisation". What this does is that if, after recording a track, a musician feels that the timing of some of the notes played was not quite right, the MIDI software can be used to shift all the offending notes automatically so that the timing becomes spot-on.

The second type of package, the step-time recorder, again stores MIDI information, but not in real time. In this case, information about the pitch and timing of each note is specified separately, either from the Qwerty or musical keyboard. A major attraction of the step-time package is that it allows the user to compose and edit pieces that would normally be beyond their technical ability on the musical keyboard.

The third type of package is designed to make the programming of synthesisers sounds easier. On some synthesisers more than 100 parameters have to be specified when programming a sound.

To cut costs, synthesiser manufacturers often build just one multi-function variable control into an instrument. This is used in conjunction with a digital read-out to alter a single parameter at a time, a time-consuming and often confusing process.

However, if the parameter values are MIDI-encoded and sent to a computer running the appropriate software, almost all of the variables can be displayed simultaneously and graphically on the computer's screen, and adjusted using the computer's keyboard, making the programming process much easier. There are software packages designed to do this for several popular sythesisers.

A variation on this theme is to use the micro to build up a "library" of parameters defining various voices. A synthesiser's limited internal voice memory can usually only be expanded using expensive plug-in Ram packs. MIDI offers musicians the much cheaper option of storing their voice data on floppy discs or data cassettes via a micro.

In addition to the three main program types, other micro applications for MIDI are emerging. The Italian Siel company, for example, has developed a digital delay program which takes in MIDI information and spews it out again after a predetermined period to produce echoes and similar effects.

A graphic example of the possibilities opened up by MIDI comes from Electromusic Research (EMR), the most prolific British producer of MIDI software and hardware. EMR's £24.95 Vu-Music package for the BBC interprets MIDI data visually in the form of a kaleidoscopic display on the computer screen.

Pressure of space does not allow us to examine individual MIDI packages but there are some general points to bear in mind when looking at MIDI packages for micros.

First there is a confusing bit of MIDI terminology. The capacity of most MIDI recorders is specified in "events" rather than "notes". In MIDI, switching a note on is one event, switching it off is another. So a recorder with a 24,000 event capacity will only record a maximum of 12,000 notes.

But, if you are also recording extra information such as velocity and pressure sensitivity, the note storage capacity is cut back further. More valuable memory is eaten up if you store information which will tell the synthesiser to change voices at certain points in a composition.

The design of any MIDI recorder program is thus a compromise between the amount of memory available for event storage and the facilities offered by the program. The screen displays tend, therefore, to be rather rudimentary compared to games software. Every byte counts.

Another point to watch for in multi-track recorders is whether there is a fixed amount of memory allocated to each track or whether the memory is divided according to the number of tracks being used and the number of notes in each.

You may have noticed that MIDI hardware and software tends to be rather more expensive than other home micro packages. This is partly because there is not yet a mass-market for MIDI packages, and partly because many existing buyers are professional musicians who are prepared to pay extra for what are, to them, tools of their trade.

This price structure is beginning to break down with the entry of companies like Island Logic and Commodore into the market. On the hardware front, for example, there is Commodore's £19.95 MIDI interface. Admittedly, it is more basic than other interfaces but it will meet the needs of most MIDI novices at less than a quarter of the cost of rival products.

There is still, however, a problem with software prices, Commodore's £14.95 Sound Studio and Island's £34.95 TMS represent extremely good value but offer only a few of the facilities included in the up-market MIDI packages.

A more annoying barrier to the wider use of MIDI with micros is that most of the MIDI software now on the market will only operate with a MIDI interface from the same supplier. The suppliers are, in effect, using the interfaces as dongles to deter would-be software pirates.

Available NOW

Imagine Software is available from: WHSMITH, John Menzies, WOOLWORTH, LASKYS, Rumbelows, Greens, Spectrum Shops and all good dealers.

(continued from page 69)

This leads to the absurd situation that if you like one supplier's real-time recorder but prefer another's step-time recorder you will have to buy two costly interfaces, performing almost identical functions, to run the two packages.

Some suppliers compound the problem by bundling the interface with an item of software which you may not need and selling separate programs which may interest you but which can only be used with the interface which is not available as a separate item.

A final word of advice if you are thinking of buying MIDI software. If at all possible, you should test the software with the synthesisers or drum machines you are planning to use. Trials with similar machines are not good enough because instrument manufacturers have a nasty habit of revising their MIDI firmware without telling anyone.

MIDI has its critics in the music industry. Some would have preferred a faster, parallel link to the serial format. Others feel that the DIN plug is not up to the job. But the present format was chosen because it offers a relatively simple and cheap way of linking instruments with each other and with micros.

Two recent developments in the micro world could help to spread the MIDI gospel. First, the trend towards 128K as the standard home micro Ram capacity could prove extremely important. It will boost event storage capacities and allow software writers to extend the facilities offered by their packages and to enhance screen displays.

But more significant is the arrival of the first general-purpose micro with a built-in MIDI interface, Atari's ST. Atari boss Jack Tramiel's decision to add $10 or $20 to the cost of the ST by including the MIDI interface shows how important he believes MIDI will become.

Next month we will look at the other method for expanding the micro's musical role — sampling. ■

MIDI MAGIC

Machine	Supplier	Package	Price	Interface	Comments
Spectrum	EMR	Performer	£39.95	£79.90	8-track polyphonic real-time recorder, 7,960 event capacity (with or without velocity), tracks can be merged.
	Micro Musical	MIDI Musician	£69.00	included	Monophonic step-time recorder, based on Romantic Robot's Music Typewriter (included), microdrive convertor.
	Siel	Live Sequencer	£21.30	£87.95	Simple 1-track polyphonic real-time recorder
	XRI Systems	Micon	£108.00	included	2 programs: 8-track monophonic step-time recorder, helpful stave display, up to 2,900 events/track; and simple 1-track polyphonic real-time recorder, auto-correct.
		Real-time Multitracker	£27.95	uses any interface	8-track real-time polyphonic recorder, 9,000 event capacity, over-dubbing.
BBC	EMR	Composer	£44.95	£79.90	6-track step-time recorder, 5,100 events, dynamic memory allocation, joystick option.
		Performer	£49.95		8-track polyphonic real-time recorder, capacity up to 7,960 events, track merging, auto correct.
		Editor	£34.95		Extra editing facilities for Performer, links it with Composer allowing data transfer.
		Vu-Music I	£24.95		Provides graphics display modulated by MIDI data, choice of type of music to be depicted.
	Hybrid Technology	Music 600	—	£129.00	MIDI hardware module for use with Music 500 system or independently, requires £35 Nucleus ROM.
	LVL	—	—	£ 39.95	Interface for use with LVL's keyboard and music ROM.
	London Rock Shop	UMI-2B	£495.00	included	ROM-based 16-track polyphonic real-time and step-time recorder, auto-correct, voice storage for DX7 synth.
	Siel	Multitrack Composer	£36.95	£99.00	6-track monophonic step-time recorder.
CBM-64 /128	Commodore	—	—	£19.95	Simple MIDI interface for use with Commodore packages including Music Studio, Music Expander and Sampler.
	EMR	Performer	£49.95	£79.90	8-track polyphonic real-time recorder, 18,000 event capacity, auto correct, track merge.
	Joreth	Music Composer System	£250.00	included	8-track step-time and real-time recorder, music composition language, auto-correct, score display.
	Rittor	Passport MIDI/4+	£79.99	£109.99	4-track polyphonic real-time recorder, 12,000 event capacity, dynamic memory assignment, auto-correct.
		Passport MIDI/8+	£119.99		8-track polyphonic real-time recorder, 12,000 event capacity, dynamic memory assignment, auto-correct, impressive demo pieces.
		Passport MIDI player	£64.99		stores music created on MIDI4+, real-time graphic display during playback.
	Rosetti	Scorewriter	£340.00	£90.00	ROM-based 12-track real-time recorder, produces detailed score print-out of real-time playing.
		12-track recording studio	£99.95		12-track real-time recorder, 7,600 event capacity, auto-correct, track merge.
	Siel	Multitrack Composer	£36.95	£87.95	6-track monophonic step-time recorder.
		16-track sequencer	£67.25		16-track real-time polyphonic recorder, 9,000 event capacity.
		Digital Echo Delay	£54.35		provides delays of 5-200ms between MIDI In and Out signals, up to 14 "echoes" possible.
	Sequential	Sequential 964	£74.95	£99.00	6-track polyphonic real-time recorder, 8,000 events, auto-correct.
MSX	JVC			£TBA	Software similar to EMR's Performer 8-track real-time recorder (see above).
Amstrad	EMR	—	—	£79.90	Interface supplied with Introduction to MIDI program on cassette.

Richard Taylor improves the Spectrum's sound

THIS PROGRAM adds a further four commands designed to enhance its musical and sound capabilities to Spectrum Basic. They start where Beep left off, providing a Play instruction which allows tunes to be played by just specifying the notes rather than having to labouriously convert them into the numerical form required by Beep. Secondly, the program facilitates the use of tone envelopes whereby the pitch of a sound varies with time to produce the laser sounds and zaps that are all too popular in commercial games. Random "noise" can also be produced and, when used in conjunction with envelopes, can be made to create some convincing effects.

The program occupies about the top 2.5K of memory just below the UDG graphics area. When run the program lowers Ramtop and proceeds to poke the machine code into memory. After a couple of minutes the computer should respond with a message informing you that the data was OK. At that point the machine code can be saved to cassette or Microdrive etc. If, however, you are presented with a message informing you of a data error in a certain line then its necessary to go back to that line and check it against the original, correcting any mistakes as you go, and re-run the program. This process should be repeated until you get the data OK message.

The machine code can be saved to tape using:

SAVE "SOUND EXT"CODE 62683,1885
Remember to VERIFY!
To reload use:
CLEAR 62682: LOAD ""CODE

The new commands are used in a similar fashion to those which are standard except that the commands have to be typed out in full — in either upper or lower case — there's no lazy single key entry system. However, before any of the commands will be accepted by the Spectrum the machine code must be initialised with:

RANDOMIZE USR 62683

This introduction completely resets the program and introduces the new commands to the Spectrum so that when Basic comes across them they'll be accepted without any quibbles. Because of the somewhat obscure manner in which it operates, any errors reported by Interface 1 disconnect the sound commands so that they are no longer part of Basic's vocabulary. To reinitialise use:

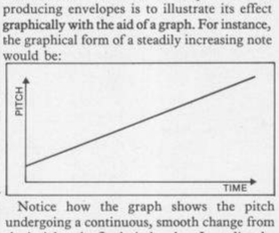
RANDOMIZE USR 62686

The most mundane of the new instructions is *Sound. In its simplest form it can be used as a substitute for Beep. In an analogous manner to Beep the command needs two arguments, the first being the length of the sound (in units of 1/100 of a second — so 300 means three seconds) and the next argument is the pitch of the sound. The pitch is described in a completely different way to that expected by Beep — the smaller the number the higher the pitch! The best way to produce a certain tone is by experimentation — there's no easy method of getting a pitch number for a specific frequency. If the pitch of a sound is made negative then noise is produced with a pitch of very approximately what it would have been if it wasn't negative e.g.

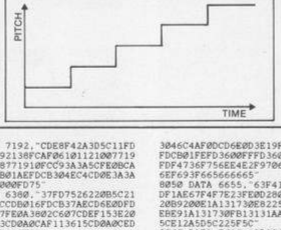
*SOUND 200, – 300

produces noise for two seconds. In fact the sound may not last exactly two seconds, when generating noise the duration you specify is only followed approximately — the sound may last much longer. If this is a problem then you'll have to compensate for it when defining sound lengths.

The *Env command is used to define the envelopes I mentioned. The definition of an envelope describes how the pitch of a sound varies from its initial value as time progresses. These tone changes give rise to the laser/zap effects which were previously unobtainable from Basic without enlisting the help of machine-code routines. A helpful aid in producing envelopes is to illustrate its effect **graphically with the aid of a graph. For instance,** the graphical form of a steadily increasing note would be:



Notice how the graph shows the pitch undergoing a continuous, smooth change from the intial to the final pitch value. In reality the computer cannot manage this but has to break the change down into a number of small, **discrete pitch variations as illustrated below:**



You decide how long each individual step wll last and by how much the pitch then "jumps" at the culmination of each of the steps.

Say you wanted to create an envelope similar to the one above, we have to specify three quantities, namely the total number of steps, the size of pitch variation after each of them and the length of each step. From these values the following can be calculated:

Total pitch change =
number of steps x size of step
Total length of env =
number of steps x length of step

Consider that the envelope is to last a total of one second and produce an increase in pitch of 100 units. Because of the weird way in which the pitch is measured an increase is represented by a decreasing pitch number — *Env uses the same method of pitch representation as *Sound. If we wanted to have a total of five steps in the effect then each would have a length of 1/5th second and a step of –20. To define the envelope:

*ENV 0,5, – 20,20

is used. The first expression after the command is the number of the envelope, in this case 0. Up to 16 completely independent envelopes can be stored in the Spectrum's memory at one time, each one being specified by a number between 0 and 15. The second expression is the number of steps, the third the pitch variation per step and, finally, the 20 is the step length in 1/100th's of a second. Since each step lasts a comparatively lengthy 1/5th second its quite easy to hear the individual steps composing the envelope. To hear the envelope type:

*SOUND –1,250,0

Notice how a third argument has been tagged onto the end of *Sound to specify the envelope to be used. The length of the sound is given as –1. This means that the envelope should be played only once. Similarly if it was –2 then the envelope would be repeated twice. Try

BASIC SOUND EXTENSION

```
*SOUND  – 5,250,0
```

The pitch value given in *Sound is the initial pitch which is decreased down to 150 by the envelope. If an envelope is being repeated then the pitch commences from its initial value at the start of every recital of the envelope. There is nothing to stop noise being enveloped in a similar fashion, try:

```
*SOUND  – 5, – 250,0
```

Note that when using enveloped noise the pitch is varied as though the negative sign in front of it didn't exist (although noise is produced), otherwise decreasing – 250 by 100 would produce – 350 instead of – 150 which is what we're after. Enveloped noise is the basis of many of the sound effects to be found in games, especially those of the "space-war" genre. In order to produce a much smoother envelope the step length has to be drastically reduced. Redefine envelope 0 with:

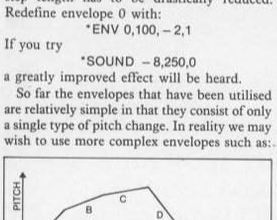
```
*ENV 0,100, – 2,1
```

If you try

```
*SOUND  – 8,250,0
```

a greatly improved effect will be heard.

So far the envelopes that have been utilised are relatively simple in that they consist of only a single type of pitch change. In reality we may wish to use more complex envelopes such as:



The envelopes can be subdivided into five discernable different sections, A-E. We could define a seperate envelope for each of A-E and play them together using a string of *Sound commands. This method, as well as being unelegant and cumbersome, is further complicated because we need to calculate the value envelope A, say, leaves the pitch at when it terminates so that we know what to use as the starting pitch for envelope B. Thankfully the *Env command allows an envelope to be composed of up to eight individual sections. We could define the above envelope as follow:

```
*ENV 1,20, – 4,2,20, – 1,2,10, – 1,4,20,4,2,
                                   20,2,2
```

Each of the five sections are 2/5th second in length, making the whole thing two seconds in duration. Try:

```
*SOUND  – 1,300,1
```

As you can hear such an envelope provides a much more complex sound.

The Beep instruction was designed for playing music rather than making exposion sounds etc. However, life still isn't easy if you're converting music since all the note values have to be converted into the relevant numbers required by the somewhat awkward Beep. The *Play command enables music to be converted without the need for any number crunching. It has a string argument which is used to contain the notes you wish to play and other associated information. Any letter from A to G found is the string played as that particular musical note — so:

```
*PLAY "abcdefg"
```

plays all the seven notes available. Of course it would be extremely limiting if you only had seven notes to play with so there is a facility to change octave.

Although the program supports eight octaves those at the extreme levels of pitch are of little use for musical purposes. In fact the upper few notes in the top octave will produce an error if you try to play them for the simple reason that the computer can't manage to produce such a high pitched sound. To change octave an O is simply put in the string followed by the new octave number — 1 to 8. all subsequent notes in that string are then played in the new octave. At the start of every new *Play the octave is reset to 3. To further increase the quantity of notes available sharps are also supported. A sharp note has a pitch slightly above — one semitone in fact; whatever that is — its ordinary value. To play a sharp note simply suffix the note with a hash character (#)

```
*PLAY "c# "
```

gives C sharp.

```
10 FOR a = 1 TO 7
20 *PLAY "o" + STR$ a + "cc# dd# eff#
   gg# aa# b"
30 NEXT a
```

This short program demonstrates the full scope of the notes available in the lower seven octaves. The O "directive" — or any other directive that needs an argument, you'll meet some more in a moment — must be followed by a number, no variables or expressions are allowed. You can, however, circumvent this difficulty by using STR$ to construct the numerical part of the string — as in the above program — out of an expression, variable or whatever.

You can play noise instead of plain notes by

(continued on page 74)

(continued from page 73)

utilising the n directive, n0 turns noise off while n1 switches it on. To hear the effect try the above program with n1 preceding the 0 in the string.

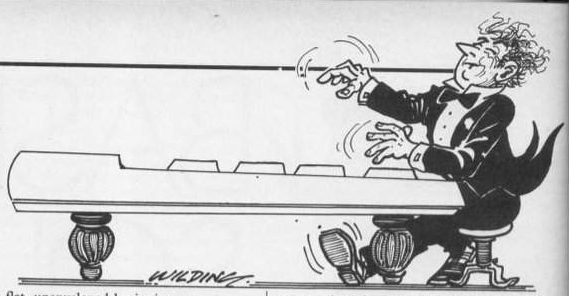
The pause (p) directive enables a silent gap, equivalent to a musical "rest" to be placed in a tune. The number following p is the length of the pause measured in 1/100ths of a second. The pause can be up to 2.55 seconds.

It is possible to modify the duration of each note using the L directive. The L is succeeded by a number between 1-255 representing the new length, in 1/100ths of a second, of each note. At the start of each new *Play command the note length is reset to 0.2 seconds. Dotted notes are also supported by the program. A dotted note is played for 1.5 times longer than an ordinary note. To make a dotted note simply put a full stop after the letter in much the same way as you would with a #.

```
*PLAY "L100c#."
```

plays c# for 1.5 seconds. If you require a dotted sharp note then the full stop should come after the #.

To add a little more interest to a tune it is possible to use an envelope. So far all the notes have kept the same tone value throughout their duration, like the sound produced by Beep. To turn envelopes on a Y directive is used. The number following the Y is the envelope you wish to use, or 16 to turn envelopes off. All subsequent notes are played using that envelope. By experimenting with a number of different envelope effects it is often possible to enhance the sound of a tune considerably from



its flat, unenveloped beginnings.

To summarise these are the directives available in a *Play string — actually, there is still one to come — I'll mention that one soon.

A-G	=	The notes.
#	=	If placed after a note will make it a sharp.
	=	If placed after a note will play it 1.5 times longer.
On	=	Lets you play subsequent notes in octave n.
Pn	=	Pauses for n 1/100ths of a second.
Nn	=	If n = 0 then noise is turned off. If n = 1 then its switched on.
Ln	=	Makes the duration of subsequent notes n 1/100ths of a second.
Yn	=	Makes following notes to be played in envelope n (or normal if n = 16).

If a certain sequence of sound commands are always used together then they can be made into a single unit called an effect. An effect is a construction of up to eight separate "sounds" strung together. Like envelopes, effects can be defined and stored in the Spectrum's memory for later, and repeated, use. You can have up to eight effects defined at any one time.

```
*EFFECT 0,1,100,200,16,100,150,16
This effect is equivalent to
*SOUND 100,200:*SOUND 100,150
```

The first value in an *Effect is the effect (0-7) and the next is the number of times the whole effect is to be repeated when used. Every block of three expressions from there onwards represents one of the maximum eight individual sounds that compose the effect. They are given in the same format as that expected by *Sound, i.e. length, pitch and then envelope number.

In an effect sequence it is mandatory to specify an envelope number, it cannot simply be left off. If no envelope is required then "16" should be specified. The only way to play an effect is by using the *Play command. An X directive, followed by an effect number, will sound the appropriate effect. ■

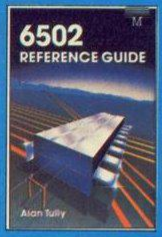
6502 REFERENCE GUIDE
A comprehensive title describing the instruction set of the 6502 processor in detail, this book covers the total range of 6502 based micros, i.e. C64, BBC, Apple and Atari.
An essential reference work for all 6502 machine language programmers. **£9.95**

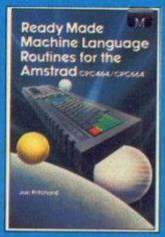
READY MADE MACHINE LANGUAGE ROUTINES FOR THE AMSTRAD
Another valuable title in Melbourne House's new range for the Amstrad.
With the help of these ready-to-run general-purpose routines, programmers will be free to spend their time in the creative development of their programs. **£7.95**

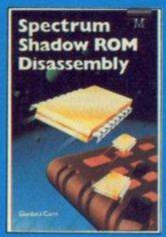
SPECTRUM SHADOW ROM DISASSEMBLY
This book provides a clear and detailed listing of the Shadow ROM in the ZX Interface 1. With numerous example programs it greatly extends the Spectrum BASIC supplying valuable information previously unavailable to Spectrum owners. **£8.95**

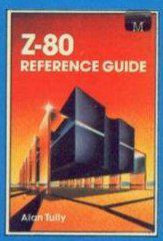
AMSTRAD GAMES BOOK
Contains a complete range of exciting games from arcade to strategy. Each game is fully listed and explained, making full use of the Amstrad's sound and graphics facilities.
The Amstrad Games Book makes learning how to program the Amstrad both easy and enjoyable. **£6.95**

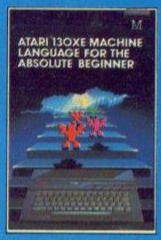
Z80 REFERENCE GUIDE
A book for owners of all Z80 based micros, such as Spectrum, Amstrad and MSX that explains the Z80 instruction set in detail.
An indispensable guide for anyone interested in Z80 machine language programming. **£9.95**

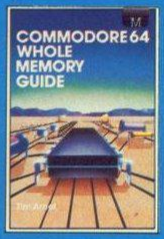












ATARI 130XE MACHINE LANGUAGE FOR THE ABSOLUTE BEGINNER
Compiled for Atari 130XE users, this book offers complete instruction in 6502 machine language in a simple 'no jargon' format.
An excellent book for those wishing to go beyond the limitations of BASIC on the Atari. **£6.95**

The Melbourne House Hit List.

COMMODORE 64 WHOLE MEMORY GUIDE
A publication for everybody wishing to utilise their C64 to the maximum.
More than just a memory map – it describes each location, its function, how the computer uses it and primarily how the programmer can use it. **£9.95**

AVAILABLE FROM SELECTED BRANCHES OF WHSMITH

TOWER OF ANTICS

WELCOME TO the Tower of the Antics. Here is a fast and smooth arcade-style game, written in machine-code, for the Commodore 64. It utilises multicoloured sprite graphics, and the smooth action is due to the raster interupt which displays the sprites 50 times a second, so no flicker.

You are Willy and you find yourself at the bottom of a tall, dark tower — the Tower of the Antics — named after the strange assortment of creatures which inhabit its depths. Regardless of how you got there, you decide to make your way to the top in search of an exit. However, your route is blocked by moving holes in the platforms which speed up after the sixth level, and the Antics themselves, who multiply, the higher you go. Don't get too disheartened, Willy is quite an agile little man, and can jump over the Antics and the holes with a bit of practice.

On your journey to the top, you will meet an assortment of weird and wonderful creatures. The green Wirrly Birrd is the most dangerous, as it flies all over the screen in order to catch you. All the others — Trumbles — furry creatures with big ears, snakes, mutant chinese teapots and strange, blue, dog-like creatures — Mugdags — move along the platforms, occasionally jumping through the moving holes to get you. Each Antic has its own peculiar way of moving — e.g. the teapot waves its lid up and down, and waggles its spout.

Reach for the top

To reach the top of each screen you must guide Willy out of the left at the bottom of the screen, and into the lift at the top of the screen. If an Antic catches you, you will be thrown to the bottom of the screen and you will lose one life, of which you have three. If you fall through a hole, you will be dazed for a couple of seconds, allowing the Antics to get closer.

Meanwhile, your oxygen supply is running out and, when it runs out, Willy will die three deaths all at once. He will though, collect a bonus on completion of each screen which depends on the amount of oxygen Willy has left, and the number of screens so far completed. There are three transporters on each side of the screen which Willy can use to take him to the other side. When the Antics reach the bottom of the screen, they go up the elevator on the right of each screen to attack you again.

There is a Top 10 high score table to record the best scores. 120,000 is a good score. To see the table press f7 or wait until it comes up automatically.

Now to the process of typing the game in. There are two programs. The first includes all the sprite and machine-code data, as well as a check routine. Both programs should be typed in and saved. From now on, every time you want to load the first program, and following must be entered directly after switching on:

POKE 642,64:POKE 44,64:POKE 46,120:
POKE 48,120:POKE 16384,0

This raises the bottom of memory available to Basic to avoid it overwriting the sprite data.

David Swinnerton with a smooth and colourful program for the CBM-64 utilising sprites.

Listing 1 can now be loaded and run in the usual way. Listing 2 can now be loaded and run, and the game is ready. I suggest that listing 1 is saved just before listing 2 so that no swapping of tapes is needed. Every time you wish to play the game, the line of pokes must first be typed in. Then both programs can be loaded and run in quick succession.

To play the game, a joystick is needed in Port 1. The directions are:

pressing left — move Willy left
pressing right — move Willy right
pressing up — makes Willy jump over hole or an Antic

pressing Fire — makes Willy jump up to new level

Obviously, pressing up and left at the same time results in Willy doing a running jump to the left, a very handy manoeuvre.

If you don't relish the thought of typing the game in yourself, then send £3.50 to David Swinnerton, 15 Bifrons Rd, Bekesbourne, Kent CT4 5DE. I will send you a fast loading version of Tower of the Antics on one side of the tape, and my other game, Auto 64 — see June issue — on the other side. ■

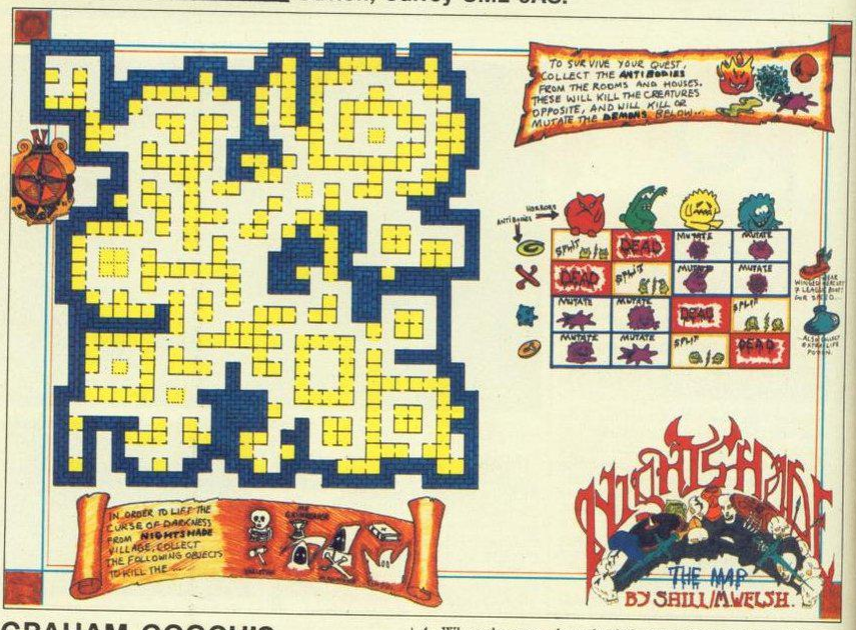
It's the dead of night — no one can hear you scream. No one, that is, except David Williams, our adventure expert. Call him on 041-770 9599 after 9pm for help with your adventure problems — or nightmares . . .

HOT SHOTS

Heard any good pokes lately? Smashed any high-score barriers? Or perhaps you've just put the finishing touches to a game map that will put thousands out of their misery. Publish and be damned — and paid! Send in your secrets, high scores and maps to Hot Shots, *Your Computer,* Room L221, Quadrant House, The Quadrant, Sutton, Surrey SM2 5AS.



GRAHAM GOOCH'S CRICKET

The following tip will allow owners of Graham Gooch's Test Cricket on the 64 to save teams.

1. Load and run the Select program, and enter the teams as normal.
2. At the end when the program exists to Basic, enter the following . . .

POKE43,0:POKE44,192:POKE45,40:POKE46,194:
POKE56,200:CLR:SAVE"TEAMS" (,8 if using disc)

3. When the teams have been saved, switch the 64 off and then on again to reset the pointers, and load the teams by entering the following . . .

LOAD"TEAMS",1,1 (or ,8,1 if using disc)

4. When the teams have loaded, enter New and then load the main game program.

D A Henry Smithson.

WIZARDRY

Rewind tape to beginning and type: Load (return) — First small bit will load. Poke 1011,248:Poke 1012,252 (return). Run (return). 'Nova' section will now load and '64' will reset. Poke 2969,0 (return).

Sys 2816 (return). The four slow sections will now load.

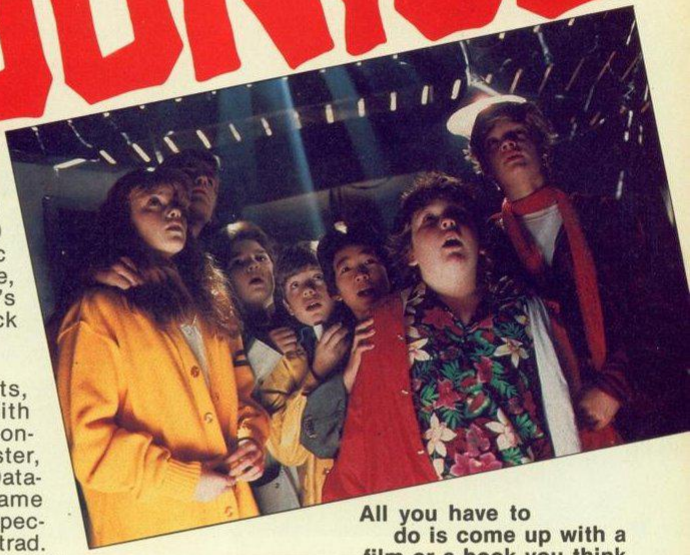
POKE 3216,255:POKE 50766,255 (return)
POKE 3264,234:POKE 3265,234 (return)
POKE 27214,234:POKE 50151,234 (return)
POKE 50152,234:POKE 50153,234 (return).

The above pokes will give you more energy and will stop most nasties from deplenishing your energy.

Sys 2970 (return). Start Game.

Jason Hattrell.

Competition THE GOONIES™



WIN

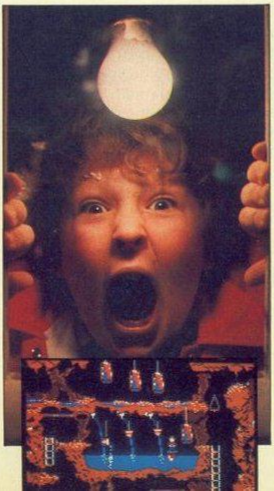
A fabulous £400 Philips CD-150 compact disc music system as first prize, plus Cyndi Lauper's Goonies Soundtrack

WIN

25 treasure chests, each crammed with doubloons, two goonies film tickets, poster, and a copy of Datasoft's Goonies game for the CBM-64, Spectrum, Atari or Amstrad.

COMPETITION RULES

- The winners of the competition will be the people who, in the view of the editor, come up with the most interesting or amusing suggestions for books or films to be translated into computer games.
- The names of the winners will be printed in the January issue of *Your Computer.*
- All entries must arrive at the *Your Computer* offices by the last working day in October 1985.
- Each person may enter the competition only once.
- Entries to the competition cannot be acknowledged.
- No employees of Business Press International or their relatives may enter the competition.
- The decision of the editor is final.
- No correspondence on the result of the competition will be entered into.
- Business Press International assumes no responsibility or liability for any complaints arising from this competition.



All you have to do is come up with a film or a book you think would make a good computer game. Send us your reasons in writing or draw a sample screen to back your claim.

YOUR COMPUTER COMPETITION

Don't forget to enclose this coupon, or a photocopy of it, when you send in your entry to Goonies Competition, *Your Computer,* Room L221, Quadrant House, The Quadrant, Sutton, Surrey SM2 5AS.

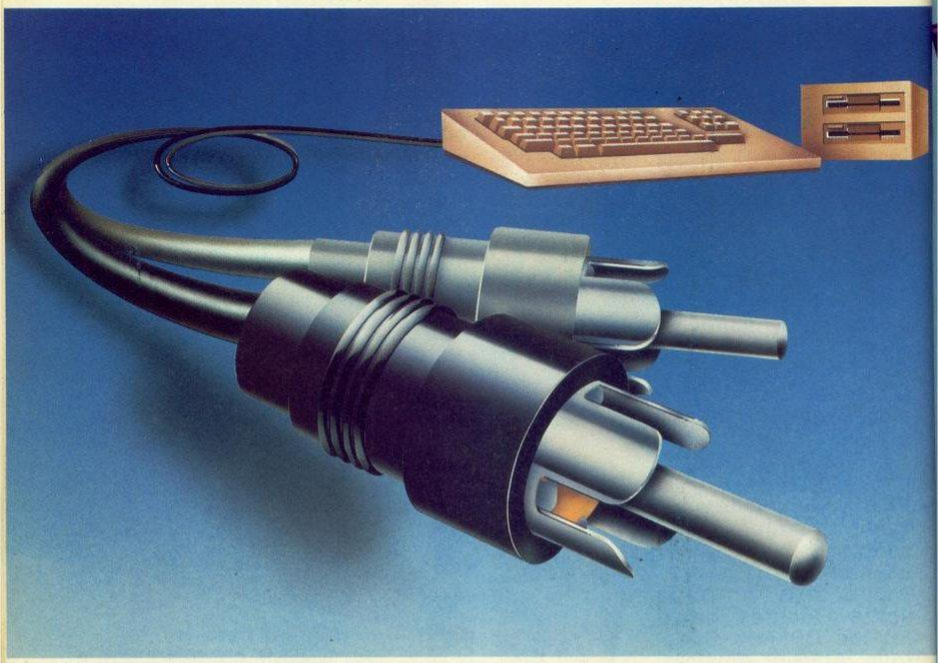
HOW DO YOU MAKE A COMPUTER SHARPER?



PLUG IT INTO A PHILIPS PERSONAL MONITOR.

A Philips personal monitor gets the very best out of your computer. It makes using your computer more rewarding as the definition and resolution gives the clear display you need.

Philips offers you a complete range of both colour and monochrome monitors. One of them is exactly right for your computer. With over 50 years in screen technology, Philips know how to give you the right image.

Philips personal monitors are suitable for virtually all personal and home computers. Just complete the coupon and we'll send you full information.

Post this to: Stephen Paul, Marketing Manager, Computer Monitors, Philips Electronics, City House, 420/430 London Road, Croydon, Surrey CR9 3QR

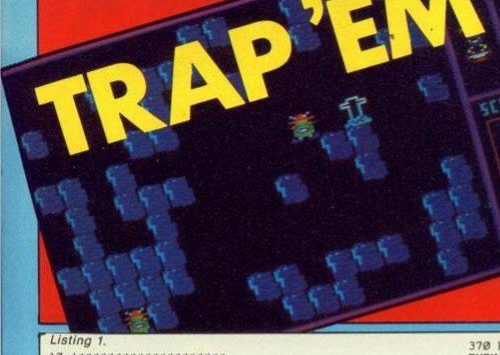
NAME: _____ Tick if trade enquiry ☐

ADDRESS: _____

_____ POSTCODE: _____ YC1

PHILIPS. TAKE A LOOK AT OUR IMAGE.

PHILIPS



THE AIM of the game is, by pushing blocks around, to trap the three aliens who are trying to get you. Once an alien is trapped it dies, and can be ignored or squashed, and when all three are dead, you move to the next level — faster aliens and less blocks.

Your man is controlled with a joystick or the cursor keys and by pressing the fire button or space bar, you can move around faster. The arrow on the score level indicates the high-score.

First type in listing 1 — save it before running as the machine will probably reset. Next type in listing 2, run it, correct the errors and save it directly after listing 1 using:

SAVE"CODE",B,36980,924

Rewind the tape and load the game normally.

Renny Garderet springs an Amstrad ambush to alienate the aliens.

Listing 1.

ASTEROID ATTACK is a program for the 16 or 48K Spectrum which is probably as close as the Spectrum allows to the arcade version. It has full rotation not limited by the scope of graphics characters; the ship is drawn onto the screen using sines and cosines. Thrusting provides the ship with frictionless motion up to a maximum speed of just less than that of a bullet.

The ship and bullets are moved to an accuracy of 1/128 of a pixel (stored — not on the screen). Obviously the sound cannot reach the high arcade standard, but I have created the best possible effects.

The machine code is created by the two high-speed data loaders. Type in the first Data Program and save a copy. Run the program and if lines 100 and 110 are correct, the machine code high-speed loader will be saved. If they are not correct, check and double check these lines until they are. If this machine code is correct, the Save and Verify statements can be removed from line 70.

After line 110 has been slow-poked, the other lines will be fast-poked into place (see the difference?). If this does not take place, reload the program and check lines 100 and 110. Don't worry about the mess on the screen as the high-speed loader runs; this is the only place to store the code as yet. When all the errors have been corrected, the code will be saved. Save another copy of the program as well. New the machine and type in program 2. You needn't bother about the lines starting with Rem.

Run the program. If the fast-load code is not in place, it will be loaded before part 2 of the machine code is fast-poked into place. Again, correct all the errors and save the code. Also save the program. New the computer and type:

CLEAR 26900:LOAD "ASCODE1"CODE

26922:LOAD "ASCODE2"CODE 29242

Play the tape on which you saved the two parts of code. The machine code is now set up. The graphics pointer can be set up by

POKE 23675,42:POKE 23676,108

and the new character pointer by

POKE 23606,42:POKE 23607,104

If you like you can test the code by

RANDOMIZE USR 28501

Type in the main Basic program. The finished program can now be saved by

CLEAR:SAVE "ASTEROIDS" LINE 500:
SAVE "ASCODE"CODE 26922,4671

You will notice if you do the Pokes above that I have designed a new character set. The capitals and digits — also all brackets, string and hash — have been made slightly larger and closer to ordinary script. An advantage of this is that capital A looks like a ship and so is used to print the 'lives'. You can shorten the typing by removing this — omit the charcter pointer

```

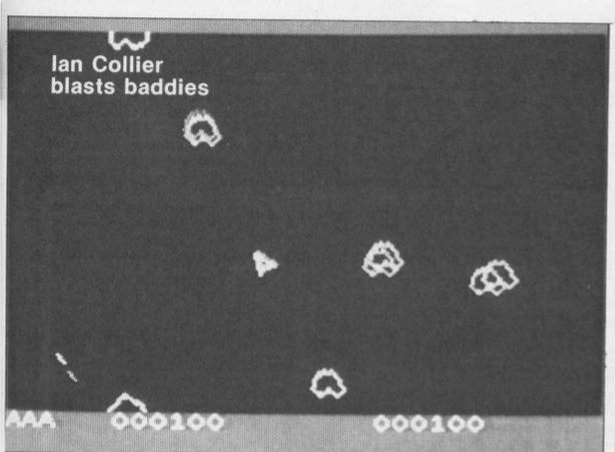
ASTEROID ATTACK



Pokes above from the program, also omit lines 120 to 200 inclusive of Data program 1 and change:

```
LET a = 16384
```

in line 70 to:

```
LET a = 17104:LET x = 20
```

You can also shorten typing by omiting the fast-poke code, though the program will take ages to poke the data. To do this, omit lines 100, 110 in Data program 1, also omit 30, all but the first statement of line 70, and change 10 to:

```
RESTORE: LET a = 16384 (17104 to omit
  the character set): FOR x = 120 (210 to
  omit the character set) TO 400 STEP 10
```

Also omit 3 and 30 of Data program 2 and add all the lines which in the listing start with Rem, but do not type Rem — (except line 1). However the fast-poke code greatly reduces poking time and can be used in other programs where hex has to be poked into memory and a checksum is provided. The syntax is:

```
PRINT USR 23296, destination, hex
```

— either a string name eg. a$ or a string of digits eg. "01ed2f"), checksum — (the sum of all the bytes in the string).

Having saved a copy of the finished program onto tape (with or without character set and/or fast-poke), you are now ready to clear the computer and load it.

You are given the option to play the game or redefine the keys — no joystick option, I'm afraid; Interrupt mode 2 on a 16K machine crashes with certain peripherals attached. If you do not redefine the keys they are X-left, C-right, L-fire, P-thrust, Z-Hyperspace, and Space-Abort. You will appear in the centre of the screen. The object is to avoid being killed by the rocks hurtling towards you by blasting them out of space. These large rocks, on being hit, will split up into two smaller asteroids, which in turn split up into two small ones.

These are destroyed when you hit them. If

(continued on next page)

(continued from previous page)

one hits you — and all crashes are screen-checked, so no gyps — you explode and, providing you have a life left, you will appear back on the screen when a box 100 by 80 pixels is clear of asteroids. If you think this box is too large or too small, you can alter its size (see Pokes Table). In a desperate situation, hyperspace takes you away from the path of converging asteroids and plants you in a random position on the screen. However, this may move you into the path of another asteroid — so use with caution.

Levels vary in difficulty, partly because more asteroids appear. There are also alien ships which career across the screen firing at you. It can split asteroids — you get the points — but this can be a hazard as more small asteroids are created. If it crashes into an asteroid, it has a chance of being blown up — you don't get the points. There are two types of alien: slow large ones — these usually blow up on contact with anything — and faster small ones — these may not blow up on contact with an asteroid. The

The following pokes are available — normal contents are in brackets.

28510 Number of lives. (do not use more than 32. However if you use more than 6, the score will be printed on top of them.) (3)

28515 One less than the starting number of asteroids. If you poke this with an odd number, you will not be able to be killed. (2)

31099 Controls the generation of aliens. A higher number gives increased probability (11).

31116 Controls the type of aliens. A higher number means a greater proportion of large aliens. (15)

The following tables hold the parameters for the box which must be clear of asteroids before your ship is printed:

30773 Left x coordinate (78)
30777 Right x coordinate (178)
30784 Bottom y coordinate (48)
30788 Top y coordinate (128)

If you abort a game with a high score, your achievement will not be recognised. To change this, remove line 310 from the Basic program. If the program seems too daunting, I will supply a cassette of the completed game for £2.00 to: Ian Collier, 57 Wyndham Avenue, Bolton, BL3 4LG. ■

SURPLUS PRINTER SALE

BRAND NEW PRINTERS FROM TOP MANUFACTURERS AT A FRACTION OF LIST PRICE!

PROFESSIONAL MATRIX PRINTER

- High definition 9x11 Matrix
- Full emulation of Epson MX80
- 100 ch/sec bi-directional printing
- Tractor or single sheet feed
- RS232 and centronics interfaces
- Full graphics capability
- Expanded & condensed print
- Comprehensive self-test
- Many other extra features
- Ideal for business micro systems
- Comprehensive manual

£149 plus VAT and £11.50 p/p

£69 plus VAT and £5.75 p/p

PERSONAL COMPUTER PRINTER

- Fast quiet thermal printing 56 ch/sec
- Full 8½in wide paper
- Full 80 column text
- Standard 8-bit ASCII 96 character set
- Standard RS232 interface
- Expanded or condensed print
- Built-in self-test
- Free 80 foot roll of paper
- Ideal for any micro with RS232
- Full instructions included

VIDEO MONITOR SALE

Brand new high resolution video monitors, green screen, in attractive case. Ideal for any micro with composite video out.

9 inch **£44** SOLD OUT 12inch **£54**

Add VAT and £12.50 carriage

SURPLUS EQUIPMENT SALE

We have a huge stock of surplus micro systems, printers, terminals, power supplies, and much more. Send SAE for current list.

Example: Brand New STC Prestel terminals **£99** plus VAT!

CHILTERN ELECTRONICS

Europe's No 1 Dealer in DEC PDP11 and VAX Computer Systems and spares.

HIGH STREET, CHALFONT ST. GILES, BUCKINGHAMSHIRE HP8 4QH TELEPHONE: 02407 71234

BETA BASIC 3.0

SPECTRUM 48K

SINCLAIR USER, JAN. 85 (ABOUT RELEASE 1.8): "HAS ESTABLISHED ITSELF AS THE STANDARD EXTENDED BASIC FOR THE SPECTRUM...TURNS SINCLAIR BASIC FROM A GOOD VERSION OF THE LANGUAGE TO A FANTASTIC ONE." NOW, WITH RELEASE 3.0, BETA BASIC BECOMES PROBABLY THE MOST POWERFUL BASIC AVAILABLE ON ANY 8-BIT MICRO!

- PROCEDURES - a terrific implementation that lets you extend your Basic! No PROC keyword is needed; e.g. you can use commands like: swap a,b or draw_box 10,20,5 or addup bl,sum. With parameter passing by value or by reference (including arrays), LOCAL variables and recursion.
- Up to 128 WINDOWS with their own attributes and character size.
- ANY CHARACTER SIZE (giving from 1 to 64 or more chars/line!).
- LISTINGS with optional automatic indentation of loops, procedures, IF, etc. Works on existing Spectrum Basic programs too!
- KEYWORDS (including the Spectrum Basic ones) can all be entered by typing them in full, or by the "single entry" method, or both in the same line.
- A full range of TOOLKIT commands. * EXCEPTIONAL ARRAY and STRING handling.
- Many powerful GRAPHICS commands. * EXCELLENT EDITOR - fast an d convenient.
- MICRODRIVE commands are improved and much easier to use.
- OTHER FEATURES, new or improved, are too many to fully list! DO - LOOP structure with WHILE, UNTIL and EXIT IF; ALTER, AUTO, BREAK, CLEAR, CLOCK, CONTROL CODES, DEF KEY, DPOKE, DRAW TO, EDIT, ELSE , FILL, GET, JOIN, KEYIN, multi-LET, LIST a slicer, LIST DATA, ON, ON ERROR, OVER 2, POKE strings, POP, READ LINE, REF, ROLL, SCROLL, SPLIT, TRACE, USING. Faster GOTOs, GOSUBs and FOR-NEXT loops.
- 26 POWERFUL FUNCTIONS: AND, OR, XOR, DEC, HEX$, BIN$; fast SINE, COSE, RND$; CHAR$, NUMBER, DPEEK, EOF, FILLED, INARRAY, INSTRING, ITEM, LENGTH, MEMORY$, MEM, MOD, SCRN$, SHIFT$, STRING$, TIME$, USING$.
- Spectrum Basic compatible - you can run existing programs. Transferable to Microdrive, Wafadrive and other special versions available.
- Comprehensive A5-size manual. More than 80 pages, packed with examples.
- To show you the power of Beta Basic's excellent procedures, we include on each tape a FREE TURTLE GRAPHICS package!
- Upgrades to Release 1.8 customers: If you bought direct from us, there is no need to return your cassette - just quote the (approximate) original purchase date with your order; otherwise return your cassette and name your number. The upgrade price of £6.95 (£7.50 overseas) includes a new manual. Release 1.8 remains available, at a reduced price of £8.95 (£9.50 overseas).
- TRANSFORM your Spectrum with BETA BASIC 3.0 for just £14.95 inclusive! (£15.50 overseas). Or if you want to know more about the program, send us an S.A.E.

(TICK AS APPROPRIATE.) PLEASE SEND ME:

[ ] BETA BASIC 3.0. PAYMENT OF £14.95 (OR £15.50 OVERSEAS) IS ENCLOSED.
[ ] BETA BASIC 3.0 UPGRADE. PAYMENT OF £6.95 (£7.50) IS ENCLOSED.
[ ] BETA BASIC 1.8. PAYMENT OF £8.95 (£9.50) IS ENCLOSED.
[ ] MORE INFORMATION ON _____ I HAVE/DO NOT HAVE RELEASE 1.8 ALREADY.

A STAMPED ADDRESSED ENVELOPE IS ENCLOSED.

CREATE C64 ARCADE GAMES!

Now you can learn how arcade games are created from scratch. Step-by-step, in easy-to-understand detail, commercial software developer Robert Woolford lets you into the secrets of the professionals.

You'll discover how to think up ideas for arcade games on the 64, and then learn how to turn those ideas into fast-moving, challenging, marketable software.

You'll discover how the experts make their programs run more quickly. You'll be shown how to maximise the real-time interaction between the machine and the player, to ensure the highest possible level of excitement is created by the games. Sample programs are included throughout the text, so techniques can be seen in action as they are described.

The book also includes a fully annotated, complete arcade game listing.

Creating Arcade Games on the Commodore 64 by Robert Woolford (ISBN 0 907563 75 9) is £7.95, and is available at most book and computer stores, or directly from the publishers, post free: *

ALTHOUGH THERE are many clever and complicated graphics utilities available for the 64 I have not come across one that allows the use of a simple "plot" facility without the bother of going into bit-map mode. Double density plotting is a method that can be used to do this and Blocks is a short and simple machine code routine that will allow double density plotting.

It utilises the fact that within the Commodore 64's built in character set are a range of block characters — quarter squares and a half squares, so that in conjunction with reverse video it is possible to display all the 16 variations of quarter squares within one character position. To put it another way, these characters can effectively double the resolution of the screen from 40 by 25 to 80 by 50.

Usual restrictions apply

Of course they are only blocks and the usual colour restrictions of the 64's display apply, but they can be very useful and because they do not need bit-map mode to be used, they can mixed freely with text on a normal screen from Basic.

The machine code routine is quite short — just over 150 bytes — and is intended to be located at 52992 (hex CF00) which is the top page of the much used 4K block of Ram from 49152 upwards. However, by changing just eight bytes you could relocate it anywhere in Ram, in the cassette buffer, for example. Listing 1 does this for you.

Listing 1 is a Basic loader program which will install the machine code routine in memory, in addition should you wish to relocate the routine then the Basic program will do this for you — simply change the value of P in the first line. The loader can very easily be made part of another program.

Once the routine is in memory it can be called form Basic by a Sys command in the following format:

SYS P,X,Y

Where P is the start address of the routine — 52992 as listed — X is the x co-ordinate (0-79) and Y is the y co-ordinate (0-49). X and Y may be any valid Basic expressions, any values out of the ranges shown will be ignored.

The only other information required by the routine is the type of plot that you want it do do. This is controlled by the contents of location 820 in the following way: a zero will cause unplotting, a one — plotting and anything else will cause Exclusive-or plotting — to change whatever is there already. Any plotting will be done in the current cursor colour so changing the cursor colour will change plot colour.

Listing 2 is a demonstration program which will plot a few things using the Blocks routine and listing 3 is a version of biorhythms which uses Blocks to plot the charts. The biorhythms program accepts date in the format 1.1.85, any reasonable character may be used to separate the numbers and an asterisk will end the program.

SPECTRUM

DRAWER

THIS IS A complex draw program for the ZX Spectrum with many advanced facilities usually found only on expensive commercial packages. These include a fill routine that can handle even the most complicated shapes, patterned fill, filled-in and empty circles, solid and dotted lines, variable cursor speed, screen magnify — magnifications — and two screen stores.

To enter the program, you should first type in the control program — listing 1 — and save it to tape or Microdrive with auto-run Line 500. You should make no changes to the program, except to the Load command in line 500 if you wish to use the program on Microdrive, as memory is tight and line numbers are important. If you do not have Microdrives, then you will be unable to enter the Microdrive Save/Load lines, so type in lines 200 and 201 again in place of lines 202 and 203.

Next:

```
CLEAR 24999
```

and type in the hexloader. If you are going to use your own hexloader, then you will have to enter the Pokes and Save command at the end of the program — line 80 — yourself after you have typed the hex in. Enter the hex from the listing, eight bytes at a time with no separating spaces, entering the checksums when prompted.

When you have finished the program will automatically save the code to tape. If you want to save it to Microdrive, you must New the hexloader first, as otherwise there will not be enough memory for the "m" channel. It is best to start off by saving everything to tape, then transfer to Microdrive later.

To test the program, first type:

```
PRINT USR 0
```

to clear the computer, then Load the control program. This will automatically Load the code and print up a menu on screen. If this does not happen, press 0 then r. If you get a menu now, then you must have forgotten to enter the Pokes at the end of the hexloader. If you do not, then you have made an error in typing in the code.

The menu has six options, numbered 0-5. Option 0 allows you to use the drawing program, option 5 will quit the program and return to Basic, and the others will bring up a submenu asking what you want to save or load.

When you press 0 you should be presented with a blank screen, except for a small information window in one corner. Assuming that there was nothing in memory before you loaded the program, the screen attributes will be set to 0, so you will be unable to see your cursor. Press Caps Shift V, then select option 3 from the Clear Screen menu.

How to use the program

I will now explain how to use the program. The first thing you will need to know is how to move the cursor. The keys Q, W, E, A, D, Z, X and C are the cursor control keys — these will be familiar to users of Melbourne Draw. When used in conjunction with Symbol Shift, these keys will scroll the screen, and with Caps Shift they can be used to move the magnification window — more of which later.

The cursor can be used in any one of the four plot modes, Set — plots point, Res — resets point-equivalent to Inverse 1, XOR — inverts pixels-equivalent to Over 1 and Skip — allows you to move the cursor without plotting. These modes are selected by the keys P, O, I and U respectively.

To change the colours on the screen you must change from the pixel cursor — indicated by SCRN in the information window — to the attributes cursor — ATTR. The L key will switch between the two cursors. The attribute cursor behaves exactly like the pixel cursor, except that it is character-sized. In Set mode, it will draw with the ink, paper, bright and flash values indicated at the bottom of the information window. These can be altered using the number keys. Keys 0-7 will change the ink — unshifted — or paper — with Caps Shift — colour, keys 8 and 9 will change the bright — unshifted — and flash — with Caps Shift — values.

Note also that, when using the attribute cursor, Symbol Shift with the movement keys will scroll the attributes. It is important to remember, with both pixel and attribute cursors, that the point underneath the cursor is not plotted until you move the cursor from it. If you wish to plot/change the attributes at the cursor position, press Enter — this will plot in the current mode, so obviously will have no effect in Skip mode. Finally, on this subject, if you wish to speed up or slow down the cursor, you can use Symbol Shift together with the number keys to select a speed. There are nine speeds (1-9) and also a special "no repeat" mode (0).

For the line and circle drawing routines, you have to specify two points — these will be the two ends of the line, or of a radius of the circle. To set one end of the line, or the centre of the circle, press Caps Shift and Enter. This defines the cursor position as the "last point". Next, move the cursor to the other end of the line, or a point on the circumference of the circle.

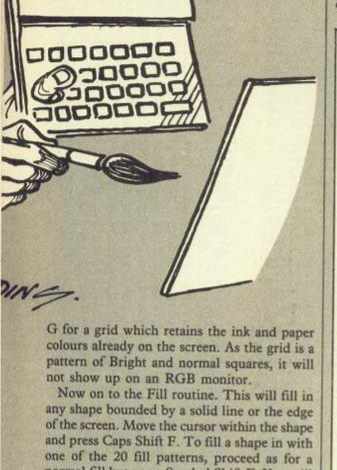
See "last point" flashing

If you press Symbol Shift and Enter together, and hold them down, you will see the "last point" flashing. This can be useful when you wish to remind yourself of its position. To draw a line — select the appropriate mode first — it is pointless drawing a line in Skip mode! — press Caps Shift and J. To draw a circle, press Caps Shift and H. Symbol Shift and H will draw a filled circle, Symbol Shift and J gives a dotted line. To change the mask for the dotted line, press Caps Shift and K — the mask is initially set to 10101010.

It is important when drawing a picture in colour to be able to see the positions of the edges of character squares, so as to avoid "attribute clashes". To help you do so, the program can superimpose one of two grids over the screen. Press G for a black-on-white grid, or Caps Shift

Hex loader.

```
 1 DEF FN b(a$)=CODE a$-48-7*(a$>"9")
 2 DEF FN h(a$)=FN b(a$(1))*16+FN b(a$(2))
 3 DEF FN b$(a)=CHR$ (a+48+7*(a>9))
 4 DEF FN h$(a)=FN b$(INT (a/16))+FN b$(a-16*INT (a/16))
 5 POKE 23658,8
10 FOR a=25000 TO 30448 STEP 8
20 PRINT a;":";: LET c=0: LET a$=" "
30 FOR g=0 TO 7: IF a$(1)=" " THEN INPUT LINE a$: LET a$=a$+" "
60 LET z=FN h(a$): LET a$=a$(3 TO ): POKE a+g,z: PRINT " ";FN h$(z);:LET c=c+ z
70 NEXT g: INPUT "Checksum:";k: IF c<>k THEN PRINT "Error": BEEP .5,50: GO TO
20
80 PRINT : NEXT a: POKE 30456,128: POKE 30457,96: SAVE "DRAWCODE"CODE 25000,55
12
```



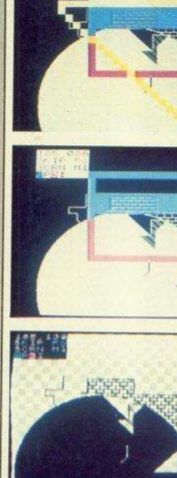
G for a grid which retains the ink and paper colours already on the screen. As the grid is a pattern of Bright and normal squares, it will not show up on an RGB monitor.

Now on to the Fill routine. This will fill in any shape bounded by a solid line or the edge of the screen. Move the cursor within the shape and press Caps Shift F. To fill a shape in with one of the 20 fill patterns, proceed as for a normal fill but press Symbol Shift F. You will be prompted for a pattern number. Select the pattern using keys 0-9 for the first 10 patterns or Caps Shift plus 0-9 for the other 10.

If you want to make up your own pattern, any of the 20 can be redefined. The patterns consist of an 8 by 8 character square, like a UDG. Draw your pattern in a character square — use the grid — and, with the cursor still in the square containing the pattern, press Caps Shift P. Select the pattern as for Fill. Pressing Symbol Shift with the number will abort the fill or pattern define command if you have selected it by mistake.

Similar to the "define pattern" command is "define UDG" — selected with Caps Shift and O. In answer to the "UDG?" prompt you should press the key corresponding to the graphic you want to define, which must be in the range A-U. Any other letter key or Break will abort the command.

Paul Rhodes and an advanced draw program.



There are two memory-stores for pictures, so that you can save a picture at any stage in development, then recall it if you have messed something up. To save a screen, press Caps Shift and I. To recall it later, press Caps Shift and U. The long-term store will retain the picture until you store something else over it, but Fill, Line and Circle all copy the screen into the temporary store so that you can undo their operation if needs be.

This can be especially important with Fill as you might find that you have left a gap in the shape to be filled, and fill in more than you want to; or you may decide you have chosen the wrong pattern.

There is a text mode

For putting text and UDGs on the screen, there is a Text mode, selected by pressing T. Type in text as normal, except that capital letters are unshifted and lower case shifted, using Caps Shift with the keys 5-8 to move the cursor around the screen. Graphics mode is selected with Caps Shift 9, which will change the appearance of the cursor and display "GRPH" under "Text" in the information window.

The information window now needs some explanation. The two numbers at the top are, of course, the cursor coordinates. They follow the normal practice of defining (0,0) as the bottom left corner of the part of the screen normally available to Basic. The bottom two lines are assigned negative y-coordinates. The second line of the window will display the mode — Set, Res, XOR, Skip or Text — and "Fo" which signifies that "Follow mode" is in operation — this will be explained later.

(continued on next page)

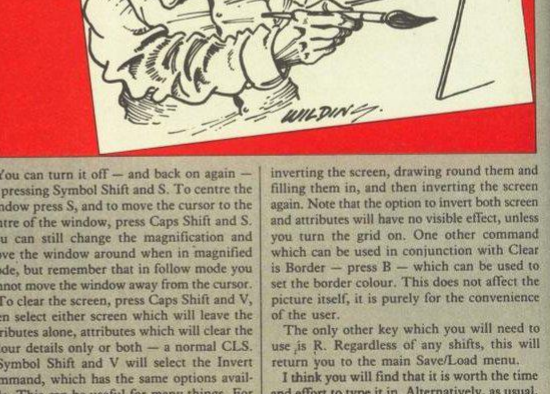
(continued from previous page)

The third line displays the cursor mode — SCRN or ATTR for the normal cursor, GRPH or nothing for the text cursor — and the magnification — so far, always 1. Along the bottom are the paper and ink colours and bright and flash settings — a bright B appears for Bright 1, a flashing F for Flash 1. The window can be turned off and on with Caps Shift N, and it can be moved by pressing N. This is normally unnecessary as it moves automatically if you move the cursor over it. So as to be noticeable at all times when switched on, the window selects black or white paper to contrast with the paper colour underneath it.

One of the most important and useful features of the program is the magnifier. This allows you to magnify part of the screen by a factor of either two or four in each direction — i.e., magnifying the area by four or 16. The area to be magnified is called the "magnification window" and can be seen by pressing Caps Shift and M — press them again to turn it off. It can be moved around the screen by pressing Caps Shift along with the cursor movement keys. Symbol Shift M will select the magnification and hence the size of the window — with a greater magnification, the area to be magnified is smaller.

To magnify the area in the window, press M. There is a special feature of the magnifier which causes the window to automatically centre itself on the cursor if it is not within the magnification window. This means that when drawing in magnified mode, the window will automatically follow the cursor when it goes off the edge of the screen and is therefore called "Follow mode".



You can turn it off — and back on again — by pressing Symbol Shift and S. To centre the window press S, and to move the cursor to the centre of the window, press Caps Shift and S. You can still change the magnification and move the window around when in magnified mode, but remember that in follow mode you cannot move the window away from the cursor.

To clear the screen, press Caps Shift and V, then select either screen which will leave the attributes alone, attributes which will clear the colour details only or both — a normal CLS.

Symbol Shift and V will select the Invert command, which has the same options available. This can be useful for many things. For example, for inverted text you should invert the screen, then put the text on the screen normally, then invert the screen again.

You can also clear parts of the screen by inverting the screen, drawing round them and filling them in, and then inverting the screen again. Note that the option to invert both screen and attributes will have no visible effect, unless you turn the grid on. One other command which can be used in conjunction with Clear is Border — press B — which can be used to set the border colour. This does not affect the picture itself, it is purely for the convenience of the user.

The only other key which you will need to use is R. Regardless of any shifts, this will return you to the main Save/Load menu.

I think you will find that it is worth the time and effort to type it in. Alternatively, as usual, I can supply it on tape for £3 — with instructions for transference to Microdrive. Orders to P. Rhodes at 104 Ventor Gardens, Luton LU3 3SW. ■

Load In-Save £5 Now!

Use this Ferguson to load in programmes. Use it to help you create programmes. Use it to save programmes. And use it to save money — at Rumbelows it's reduced from £24.99 to £19.99!

THIS FERGUSON COMPUTER DEDICATED CASSETTE RECORDER

ONLY £19.99

MODEL 3T31

FREE! Buy the Sinclair Spectrum Plus at £119.99 and get this recorder free. Hurry while stocks last.

THE FERGUSON 3T31 IS COMPATIBLE WITH MOST COMPUTERS, INCLUDING SINCLAIR, ORIC, ACORN ELECTRON, BBC B. FULL DETAILS AND WRITTEN QUOTATION FOR CREDIT TERMS AVAILABLE FROM ANY RUMBELOWS BRANCH. ALL ITEMS WITH A REDUCED PRICE HAVE BEEN ON OFFER AT THE PREVIOUS PRICE AT MOST BRANCHES INCLUDING HENEL, HEMPSTEAD BUT NOT NECESSARILY FOR 28 CONSECUTIVE DAYS IN THE LAST SIX MONTHS. HEAD OFFICE: TRINITY HOUSE, WALTHAM CROSS, HERTS EN8 7DB.

Trust RUMBELOWS

YC1185

THIS PROGRAM gives you 13 extra graphics commands. The Inverse and Copychar commands are text-orientated and the others are graphics orientated. The Stipple command affects both graphics and text. After the Ston command has been used all text is stippled as well as all points plotted, all lines drawn and all shapes filled. When using stippled text no text will be printed when the graphics pen and paper are equal since the graphics Tag mode is used to print the text.

Any stipple level may be fully edited provided that the background colour does not appear within the stipple parameters. The Stoff command will return the text and graphics to their original pen and paper colours. If the Paint command is used while the stipple effect is on unpredictable patterns will occur due to the order in which points are plotted. To fill a shape with stipple I would advise the use of the Box, Ellipse and Circle commands with the Fill command on.

Any colour parameters used refer to the pen and paper colours currently selected and will respond to mode changes in the same manner as does Amstrad Basic. For example, if the stipple colours are selected by:

STIPPLE,1,2,3,4,5,6,7,8

then in mode 0 all eight colours will be used, however in mode 1 these colours will appear Mod 4 and the stipple will be equivalent to:

STIPPLE,1,2,3,4,0,1,2,3,0

If the incorrect number of parameters for a command have been entered the routine will return to Basic and display an error message.

Type in the data from program 3 followed by program 1. Once program 1 has been run the code can be saved by:

SAVE"CALL 38155",B,37985,2220

To load this data type:

MEMORY 37985:LOAD"CALL 38155"

and to use the new commands type:

CALL 38155

Remember that if you wish to use the Symbol After command it must be set above the Memory command.

GRAPHICS AMSTRAD

Program 1.

```
10 DEG:FOR F=0 TO 255:POKE (156*256)+F,SIN(F/255*180)*
255:NEXT
```

Program 3.

```
10 REM Hex loader
20 REM use this program to enter
30 REM hex dump code
40 REM Type in each line of 20
50 REM hex digits as a single string
60 REM and then the checksum. E.g.
70 REM for the first line enter the
80 REM digits from F to 1
90 MEMORY 37985
100 FOR n = 37986 TO 39906 STEP 10
110 LET t=0:PRINT n; ":";
120 INPUT a$
130 FOR c = 0 TO 9
140 s = VAL("&"+MID$(a$,c*2+1,2)):POKE (c+n),s
150 t = t + s
160 NEXT
170 PRINT " = ";:INPUT ch
180 IF ch<> t THEN PRINT "input error
   - try again": GOTO 110
190 NEXT
```

Andrew Ware with a suite of 13 new graphics commands for the CPC-464.

After command it must be set above the Memory command.

|BOX,x co-ordinate,y co-ordinate,width, height [,ink]. This command responds to FILL. With |FILL,0 an outline of the box is drawn and with |FILL,1 the box is drawn and filled.

|CIRCLE,x co-ordinate,y co-ordinate,radius [,ink]. Circle responds to FILL. With |FILL,0 the circumference only is drawn and with |FILL,1 the circle is filled.

|COPYCHAR,column,row,@variable%. Returns the CHR$ value of the character at the given row and column position from the integer variable following the "@" character.

|ELLIPSE,x co-ordinate,y co-ordinate,width, height [,ink]. Ellipse responds to FILL in the

Hex dump.

S EXTENSIONS

same manner as circle.

|FILL,integer.| FILL,0 turns fill off. |FILL,1 turns fill on. FILL responds to the stipple command.

|GPAPER,graphics paper colour. The background graphics paper is set to the colour specified.

|GPEN,graphics pen colour. The foreground graphics pen is set to the colour specified.

|INVERSE,integer. |INVERSE,0 turns the inverse mode off and text is printed in the current pen colour on the current paper colour. |INVERSE,1 turns the inverse mode on and text is printed in current paper colour on the current pen colour.

Paint responds to stipple

|MASK,integer. Sets ink mask: |MASK,0 Force mode. Pixel plotted over background. |MASK,1 XOR mode. Pixel XORed with background pixel. |MASK,2 AND mode. Pixel ANDed with background pixel. |MASK,3 OR mode. Pixel ORed with background pixel.

|PAINT,x co-ordinate,y co-ordinate[,ink]. Paints an enclosed area of the graphics window around the point x,y. This command can be terminated by pressing Ctrl and C keys together. Paint responds to stripple, however the results are unpredictable.

|STIPPLE,pen 1,pen 2,pen 3,pen 4,pen 5,pen 6,pen 7,pen 8. Sets the order of pixel colour While stipple is activated the current graphics pen colour is ignored. Text will be printed in current stipple colours.

|STOFF. Turns stipple off.

|STON. Turns stipple on.

Terms in brackets are optional and all co-ordinates are relative to the current graphics origin. ■

MAKE THE RIGHT CONNECTION FOR UNDER £200*

DWP 1120

To find a letter quality daisy wheel printer for under £200.00 you need the right connections.

At Quen Data we've got the right connections in more ways than one.

Firstly our DWP 1120 Daisy Wheel Printer comes with a choice of Centronics interface or an optional RS232C interface.

Consequently it can connect directly with virtually any micro on the market.

Secondly our 'Daisy Chain' of dealers are conveniently spread across the country, making it easy for you to drop by and check out the hardware.

Talking of which, originally designed for professional users, the DWP 1120 combines stylish good looks with total practicality.

With features you'd only expect to find on much more expensive machines it's a powerful companion for any home micro, giving you complete word processing documents and data listing facilities, all at the touch of a button. (Tractor Feed and Single Sheet Feeders are easily fitted options).

In fact whatever your printing requirements, a glance through our list of dealers followed by a quick visit should convince you that with Quen Data you've made the right connection first time.

CHANGER

WHEN LECTURING I often include informal definitions of computing terms to make them more memorable to students. My informal definition of a utility is a program which makes life easier for an operator or a programmer. The utility presented here falls into the latter category. This machine-code program does nothing that cannot be done from Basic; but it does it much faster and with much less bother to the programmer.

The utility is designed to manipulate the colour attributes of a BBC's mode 7 screen. A simple call is included to invert the colours — excluding black and white; a more involved series of calls will select an area of the screen to be affected, and allow a more precise exchange of attributes. All of this could be done from Basic; but would involve the program keeping track of the position and nature of teletext control codes. The memory involved for this may be greater than the memory occupied by this utility; and it would certainly execute more slowly.

Teletext — mode 7 — screens have colour and other attributes set and controlled by character codes in the range 129 to 159 Ascii. A control code on a line will control the manner in which succeeding characters on that line are presented by the hardware. Such codes only affect the current line up to either the end of the line or an overriding code on the same line.

An example may make this clearer; suppose the message "HELLO!" is required to be presented in red text. The red text control code is given in the user guide as Ascii 129 (page 486). This can be incorporated into a string by the command

```
string$ = CHR$(129) + "HELLO!"
```

When this string is printed onto a mode 7 screen the control code will occupy one character position and the text will follow it in red. The colour will be changed by a following colour code or by the end of that line. If it is wanted to change the colour from red to blue; it is only necessary to change the control code from red text — 129 — to blue text — 132. It is not necessary to rewrite the text itself.

The utility presented here, if called without any parameters will cause a predefined change in text and graphic colour attributes. These predefined changes are red to green and vice versa, yellow to blue and cyan to magenta and vice versa. White codes are not affected.

```

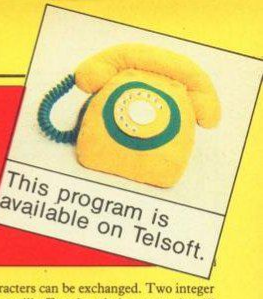
Fintan Culwin with a quick change on the BBC.



The default of the whole screen can be modified by adding four integer parameters to the call. These parameters define an area of the screen in the order leftX, rightX, topY and bottomY. Only the codes in this area will be changed; but the effects of the codes may extend to the right of the area.

More selective control of the changes can be made by specifying two or six integer parameters. Two parameters indicate a code to be found and a code to replace it. These codes are not limited to teletext control codes; any Ascii characters can be exchanged. Two integer parameters will effect the whole screen; six will select an area of the screen. The first four define the area as before; the last two specify the codes to be found and replaced respectively.

Only a limited error checking is provided. A check is made that the machine is in mode 7; and a check is made that the correct nns only. The left/right and up/down should be in the correct order and within the confines of the screen. If these conditions are not adhered to unexpected and possibly disastrous results will be obtained.

For the non technical all that is necessary is to copy out the listing. It is configured for tape based systems to occupy memory from &D00 onwards; it extends beyond the normal start of user memory &E00; so it will have to be protected or assembled for a different area. When run the code is first assembled and then tested with all four possible types of command. Once tested the start, end and execution addresses are displayed allowing a working copy to be saved. ■

SOME PEOPLE make a fetish out of "good" programming. Computer academics run riot with the idea that any Goto instruction in a program should be erased as though it were a manifestation of the Devil himself. Other people have more laid back attitudes which do not necessarily help to produce tight, error proof, well documented programs that can be used by someone other than the author.

As usual, a sensible mid-point between the poles of opposing arguments seems to produce a good outcome; there are solid advantages in structuring a program so that the logic of the steps that the computer needs to follow is set out clearly and simply; while an occasional Goto, with a local destination and not crossing any exits from the segment of the program in which it is used, produces no confusion and can save space and effort.

I tend to write programs out of my head and the tidying up gets done later on when I have some idea that I can achieve what I want to do. That's the opposite of what you might be taught about "proper" computing but it's human and the end result may not be so bad. What you do need is a sense of the good structure at which you are aiming finally.

Figure 1 is a listing of Wychwood; a plotter control language for the BBC micro. I wrote the program originally because I wanted to control the sophisticated features of an Epson HI-80 plotter and that's quite difficult to do using Basic, spreadsheet programs or a word processor. The version listed here is adapted for the Oric-1/Tandy four colour plotter.

All computer langauges allow you to construct a series of steps, or program instructions, that the computer will follow when the program is run. If you are writing a language in Basic you need some way of inputting and storing the steps that the computer is to carry out.

It would be possible to enter each step at the keyboard, store the sequence on tape or floppy disc and then run the program by starting the tape and reading each instruction as it occurred. One obvious difficulty of this method is that all programming languages provide facilities to repeat a series of operations until a desired result is achieved.

With the program steps stored on tape you'll have to rewind the tape each time the program went round the loop. That seems a bit slow and perhaps boring — but it could be done.

Another method of holding the instructions that your langauge must follow is to place the program steps into a Basic array. Finding the start of the program is easy, to find the next instruction you need only increment a counter by one, and loops are easy to establish and run as you can alter the value of the counter to point to the instruction after the label that marks the start of the loop.

For example, Wychwood uses the array A$ to hold the series of instructions that form a Wychwood program.

The idea of using an array to store the instructions that are to be carried out by Wychwood is fine so far as it goes. But first of all the program you have written to control a plotter will be lost when the power to the computer is turned off, and second, the BBC computer is comparatively short of space for very large arrays.

In fact, the second objection is a good thing because it leads to a neat solution which removes all practical limitations on the size of plotter control program you can write and gives

Figure 2.

```
WRITE      a new plot sequence
EDIT       the current plot array
STORE      the plot array to disc
READ       a plot array from disc

PLOT       the current array
LIST       the current plot array

CATALOGUE     the current disc
DRIVE      alter the data drive

TEXT spool array to text file

EXIT <X> to BASIC
Which C D E L P R S T W X
```

```
WYCHWOOD - Plot array editor
----------------------------

APPEND instructions to array

DELETE instruction

INSERT instructions into the
       array.  Enter <0> to
       exit the insert mode

MODIFY an instruction

EXIT <X> the editor to
       return to the MCL
```

OOD

John Dawson with Wychwood, a plotter control language for the BBC micro to control the features of the Oric-1/Tandy.

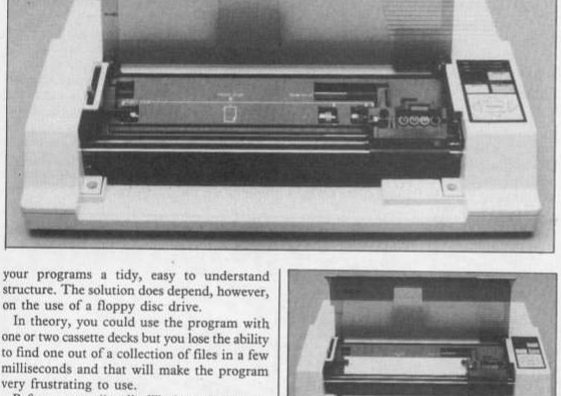
your programs a tidy, easy to understand structure. The solution does depend, however, on the use of a floppy disc drive.

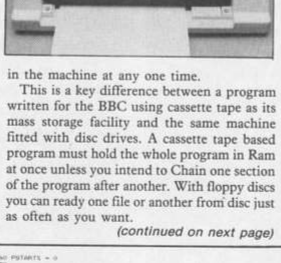
In theory, you could use the program with one or two cassette decks but you lose the ability to find one out of a collection of files in a few milliseconds and that will make the program very frustrating to use.

Before you can "run" a Wychwood program, you need to be able to enter the instructions into the program array, save the program on a floppy disc and read it back into the computer. Nobody writes correct programs in one go and Wychwood has an editing facility that allows you to Modify, Delete, Insert and Append instructions to those already in the array. The functions available from the Main Command Level (lines 210-350) are:

W Write a new program
E Edit the contents of the A$ program array
S Store the A$ array on disc
R Read a program from disc into the A$ array
D Change the current data disc — default '1'
P Send the contents of A$ to the plotter
L List the A$ program array to a parallel printer
C Display a catalogue of the current data disc
T Produce a text file from the current A$ array
X Exit the Wychwood program to Basic

For my own education, I decided that I wanted to show different prompt messages and instructions on screen at various places in the program. It is inefficient to try to store these as part of the Basic program because the relatively large amounts of textual information seriously detracted from the data you can hold





in the machine at any one time.

This is a key difference between a program written for the BBC using cassette tape as its mass storage facility and the same machine fitted with disc drives. A cassette tape based program must hold the whole program in Ram at once unless you intend to Chain one section of the program after another. With floppy discs you can ready one file or another from disc just as often as you want.

(continued from previous page)

Procinstructs (lines 1190-1290) sets up a text window on the left hand side of the VDU, clears the screen and then reads a sequential text file, printing it to the screen until the End of File marker is reached.

Having loaded the instruction file, the remainder of the procedure to write a new Wychwood program is pretty straightforward. The program line number is printed by line 1100 and line 1110 accept into Z$ any alphanumeric characters that you type on to the keyboard. This is important because many plotter commands contain commas which will terminate the normal Basic Input instruction — pages 277 and 278 in the BBC User Guide.

Wychwood has the facility to turn the contents of the A$ Basic array into a text file. The Wychwood Main Command Level loop will go (if you press T — line 340) to Procspool_Text. Procspool_Text deletes the old file 'T.DEFAULT' on the program disc and then prints the program instructions currently held in memory to a new text file "T.Default" in lines 3480 and 3490.

The plotter is not turned on because Procstart_Up is not called before Procplot. The next stage has to be done manually when you copy the default file from the program disc to the data disc, if you are using two disc drives, and then rename the file to the name of whatever element it will form in the final program.

Because Procspool_Text calls Procplot, which will read existing element text files in the course of printing out a plotter program, it is possible to repeat this process more than

once, increasing the size of the text file each time.

My BBC micro is fitted with version 2 of the Basic interpreter and that means that the Openup instruction should be replaced by Openin for those people working with Basic 1.

Wychwood has changed since last month and the interpreter procedure — Procplot — has grown as I have added new commands to the Wychwood repertoire. In order to make the program easier to adapt to different plotters I have written a new procedure — Proccx — which reads the low level commands that are to be sent to the plotter when a high level program instruction is encountered.

AXIS-1

for example, restores the data pointer to line 4050 and then reads five commands from the data in the line. This method concentrates the data that will need changing when the program is adapted to a different plotter, in one place.

The program is incomplete and must be structured to some extent to suit the particular needs of an individual. Nevertheless, the procedures for writing and editing the contents of a single dimension array, and storing and retrieving the array on floppy discs are complete and working well. Additionally, the program can display large quantities of information to guide the user when Wychwood is operating.

An interpreter of this sort can be used for many purposes, not just for controlling a plotter, and, because it is written in Basic, it is very easy to extend or modify the actions that will be carried out when a particular instruction is executed. The speed of execution should be entirely adquate for many domestic tasks as well as some applications in school laboratories.

Extracting parameters from the text strings in a single element array is not impossible but tends to be a clumsy business using Basic. If the machine you wish to control, an astronomical telescope or an automatic heating and watering system in a greenhouse, for example, requires a fixed number of parameters associated with each instruction, you may find life far easier if you use a multi-dimension array to store the program.

You could use a single dimension string array to store the instuction name and a two or three dimension integer or real array to hold the parameters. The program pointer will identify the current elements in each array, linking the instruction name to its associated parameters or values.

If, to save typing and additional work to create the Command, Element and Editor files, you would like a copy of Wychwood as it is listed in this article with the additional files, write to me at *Your Computer* enclosing your return address in block capitals, a note of whether you want the program on a 40 or 80 track disc and a cheque for £5.75 to cover the cost of the disc, post, packing and copying.

The Torch		12.95		{CP/M disc Tutorial}	
The Colt	12.95	{Fast integer BASIC compiler}			

All prices in £ sterling. *Coming soon!

Here's what other people say about HiSoft Software:

Our Customers:

C "more addictive than any arcade game" *R. Walker*

Devpac80 "a brilliant piece of software" *A. Brown*

Ultrakit "a great acquisition" *J. Le Page*

The Press:

Pascal "if you wish to teach yourself Pascal ... you won't go far wrong to buy HiSoft's Pascal" *PCF 1/84*

Devpac "it is impossible to recommend any other development package for the Spectrum" *ECM 4/84*

C "the most welcome addition to the Spectrum catalogue since Sinclair introduced the Microdrives" *Sinc. User 12/84*

Font64 "the manual is clear ... very simple to use" *PCT 7/85*

These are only a few of the glowing comments that we have on file showing that user and critic alike find HiSoft software offers a refreshing change of style.

We produce and market a wide range of high quality, professional and well-documented software packages for the popular home micros. Our type of software is becoming increasingly more popular as people get tired of zapping aliens and want to put their brains to work; learning new computer languages (Pascal, C, Devpac), investigating their computer's power (The Knife, The Torch) or being artistic (Font64), we have it all. Please feel free to write to us or 'phone for full technical details of any of our products. The above prices are fully inclusive and you can order directly from us or through your local computer shop.

COLT–A BRAND NEW ZX BASIC COMPILER

HiSoft Colt is an extremely fast and friendly compiler for ZX Spectrum BASIC. Fully supports ZX Microdrive, comes complete with sprite handler, window handler and toolkit, converts programs to run typically 100 times faster and is only £12.95.

HiSoft, 180 High Street North, Dunstable, Beds. LU6 1AT Telephone (0582) 696421

CAR CURE

CAR CURE will transform your micro into an **expert mechanic** to help you **find faults** on your car and then **determine the cure.**
Technical Colleges buy **CAR CURE** to help students **learn** about the faults cars suffer, as well as their symptoms and cures. Now you too can benefit!
Complete with comprehensive **5000-word User Guide** and packaged in a long-life plastic wallet. Export orders get American-English cross reference. All for less than many garages charge for an hour's work!

Cassette for **48K Spectrum** *(microdrive transfer instructions free, on request)* and **Amstrad CPC464** at only £9.95.
Disc for **BBCB** *(state 40 or 80 track)* at £11.95.

★ **REVIEWS**

"... works extremely well, a great deal of effort has gone into making it user friendly as well as functional ... a very worthwhile package"
–CRASH

"... an expert system ... incredibly easy to use"
–Popular Computing Weekly

"... well produced ... a worthwhile addition to your toolkit"
–ZX Computing

"... one of the most useful programs I have ever used. Makes 'xyz' look very childish and useless. A software company to keep an eye on"
–ZX Appeal (Canada)

★ **COMPREHENSIVE**
+ 900 faults
+ 300 symptoms

★ **POWERFUL**
+ Discover faulty parts for every symptom
+ Display faults for every part
+ Recommended cure for every fault
+ Trace symptoms of any fault
+ Identify faults causing two symptoms
+ Mark items for easy reference
+ Eliminate faults checked OK
+ Review progress on summary screen
+ Call help if in difficulty
+ Save diagnosis in data file

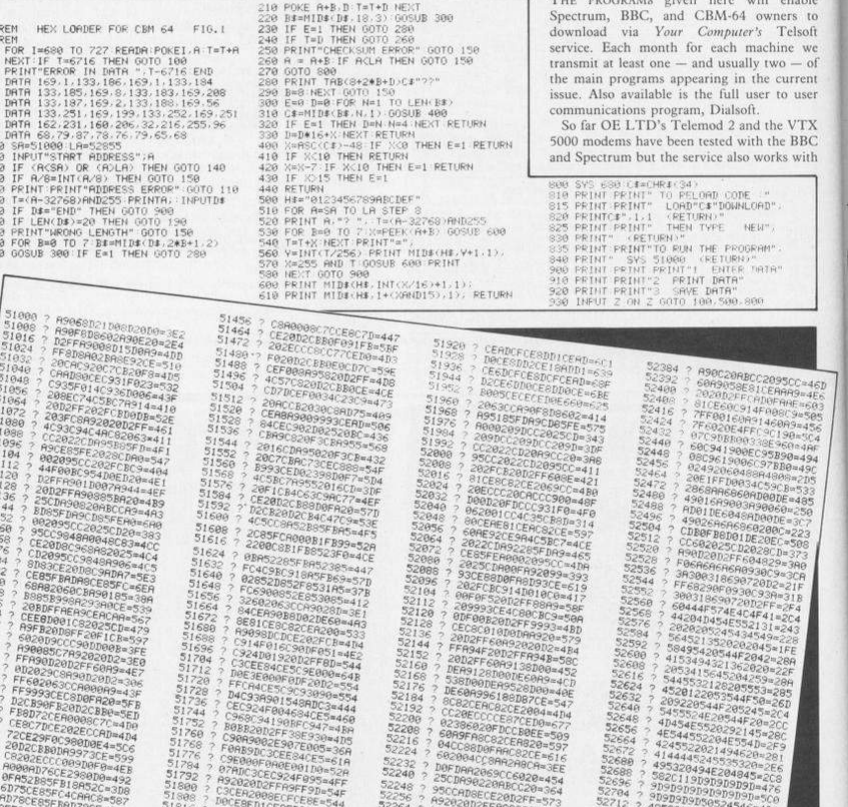
THE PROGRAMS given here will enable Spectrum, BBC, and CBM-64 owners to download via *Your Computer's* Telsoft service. Each month for each machine we transmit at least one — and usually two — of the main programs appearing in the current issue. Also available is the full user to user communications program, Dialsoft.

So far OE LTD's Telemod 2 and the VTX 5000 modems have been tested with the BBC and Spectrum but the service also works with



ELSOF

A reminder of how to use the Telsoft service.

a number of other makes. For the CBM-64 it will initially only be available with the OEL Comms pack together with the Telemond 2 or similar modem; later we hope to adapt the service to work with Commodore's modem.

To enter the download program first type in the hexloader for your machine — figure 1 — and then enter the machine code — figure 2. Once the program has been saved you can run it by entering CALL &6000 on the BBC, SYS 51000 on the CBM 64, RANDOMIZE USR 60000 on the Spectrum.

To find out what is available and how to receive software dial up Colchester (0206) 8068. This audio recorded information line will also advise you which telephone numbers to ring for the 300 and 1200 bit/s services.

When a program you want to download is on line, make sure your modem is set up and dial the number appropriate to its speed. As soon as you hear the modem tones switch the modem to line and replace the receiver. Select Option 1 from the menu — Receive. After a block of data is received you will see "OK" printed if there are no errors, otherwise the program will wait for the blocks to come round again. When the "Program loaded OK" message appears return to the Telsoft menu and select Option 5. You can now save and run the program.

Note that CBM-64 owners will need to use Option 6 if machine code is to be saved.

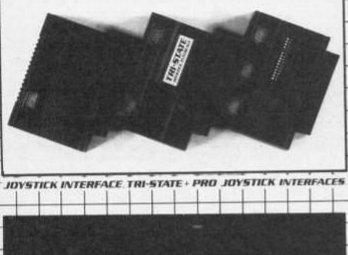
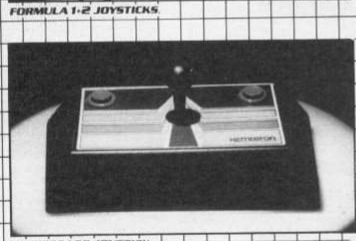
KEMPSTON MICRO ELECTRONICS LTD



JOYSTICK INTERFACE TRI-STATE + PRO JOYSTICK INTERFACES

FORMULA 1+2 JOYSTICKS



SCOREBOARD JOYSTICK

ORDER FORM

Available direct from Kempston Micro Electronics Fast mail order service Please send me the following

- ☐ Formula One Joystick £16.95
- ☐ Formula Two Joystick £11.95
- ☐ **SCOREBOARD** Joystick £19.95
- ☐ Joystick Interface £9.95
- ☐ **TRI-STATE** Joystick Interface £12.95
- ☐ Pro Joystick Interface £16.95

SPECIAL COMBINATION OFFER

- ☐ Formula One Joystick + Joystick Interface £19.95
- ☐ Formula Two Joystick + Joystick Interface £17.50

Name

Address

All prices include VAT and Postage and Packing. Overseas order add £4.00 pp. Please allow up to 14 days for delivery

EXPERT SYSTEMS ON YOUR MICRO!

Now you can explore the exciting world of Artificial Intelligence in action, with the latest book from top-selling computer author, Tim Hortnell.

Exploring Expert Systems on your Microcomputer makes Expert Systems accessible to you in a way which has never been done before. With machine-specific listings for SPECTRUM+ and SPECTRUM, AMSTRAD, BBC MICRO, COMMODORE 64, and all MSX machines, plus any machine furnished with Microsoft BASIC, Tim's new book opens up the world of Expert Systems in a direct, practical way.

The book discusses, in some detail, the most successful Expert Systems developed to date (including PROSPECTOR, MYCIN and DENDARL) and shows how the field has developed over the past decade. Ready-to-run Expert Systems programs in the book include AUTO MECHANIC and MEDICI (to give yourself a quick 'stress check'). The major Expert System in the book delights in the name of FUZZY RITA. This program uses fuzzy logic within the framework of an Expert System shell to produce a genuinely useful expert on just about any subject you choose, from chicken sexing through to medical diagnosis and weather forecasting. You'll also be given the chance to explore the languages which dominate the Artificial Intelligence and Expert Systems worlds. The book contains BASIC emulators of PROLOG and LISP so you can get them up and running on your computer, without having to actually buy the languages.

Exploring Expert Systems on your Microcomputer, by Tim Hortnell (ISBN 0 907563 74 0), is £7.95, and is available from most book and computer stores, or you can get it direct by mail, post free, from the publishers:

Interface Publications Ltd., Dept YC,

London W8 5NP
(Trade only: WHSD Leicester)

Interface

I could do that...

In support of his one man campaign against the structuralists John Ransley asked you to desing a haywire program for September's competition. It had to combine a loop with a liberal sprinkling of Gotos and Gosubs; and, most importantly, there were to be no elaborate modules. M. Wright, 2 Rye Lane, Halifax, HX2 0QB, wins the £15 prize for his Spectrum Ducksheet program. While the program may not be as messy as John Ransley would like, the author has successfully managed to avoid any suggestion of a logical structure. This month's competition continues our policy of reviving the arcade classics. A Basic version of Space Invaders is in the pipeline. We would like you to follow it up with Breakout in Basic. Remember that the program should be as compact as possible — no more than 20 lines long, and don't worry about sacrificing non-essential features.

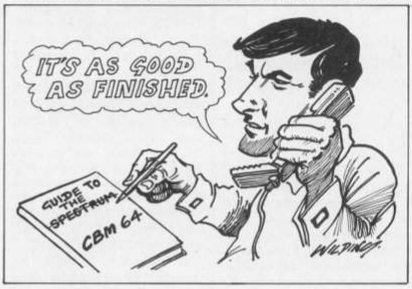
BEGINNERS *first bytes*

Starting out in home computing? First Bytes is for you. Just write to *Your Computer* with any hardware or software problems, no matter how small or simple.

A bluffers' guide to micros



REMEMBER THE computer-book boom, with each new machine followed by enough "instant books" to start a paperchase to Alpha Centauri? *The MicroGrot Explained ... Revealed ... Unzipped ... Hit With A Sledgehammer.*

Bluff reigned supreme. Some of these books managed to be less useful than the supplied manuals, which generally takes some doing. A programmer's idea of a manual opens with several chapters describing special and incomprehensibly powerful features: only experienced users know to turn to Appendix F, section VI, subsection 3.14, to find the footnote on how to switch the machine on and load programs.

And those were people who *knew* about the wretched gadgets. In computer publishing's days of glory, *The MicroGrot Explained* could be written by anyone, and usually was. The following bluffer's tales are true, but names are omitted to protect the innocent (me) from the guilty ...

"Why not write a *Basic For The Very Stupid* book for your computer?" asked a friend who'd written two. "Money for old rope."

"I've only had it a month," I said evasively.

He gave me a look. "I haven't even *got* one, and I've sold two books on it. Haven't written them yet, but it should be a doddle. It's all in the other books."

Far off, you could hear the crash of mighty pines being felled.

Another pal gloated over lucrative video commissions, with masterworks to be delivered within the week. With gritted teeth I quote: "It's great fun though — and rather silly — we've only had the Spectrum for a fortnight and we have to appear both wonderfully knowledgeable and highly skilled. This is difficult to put over when you have to spend five minutes searching for the word "or" or "to" or whatever ..."

Something snapped inside me when the author of *A Moron's Guide To The Spectrum* dropped in to research his *Moron's Guide To The Commodore 64.* Conscientiously he spent whole minutes researching my 64; meanwhile I flipped through his hideously matrix-printed draft introduction. "Ha ha," I quipped, "it says *Spectrum* here — anyone would think this was your Spectrum introduction again, and you missed that one when you changed the name to CBM-64."

"Er yes well um," he said sheepishly. "That's right."

After this it seemed quite possible to believe people had published authoritative, hands-on explanations of the QL before ever seeing the machine. Like lifelong nuns writing sex manuals.

It's harder now to flog easy-to-read, easy-to-forget works titled *Rearranged Bits From All The Other Books On The Spectrum.* I've given the thumbs-down to a couple myself: because I'm a world authority on not writing computer books, publishers occasionally ask me in to sneer at submitted manuscripts. My favourite was a book of CBM-64 graphics programs — *none* of which worked on my 64. There are three variants of the machine, distinguished by what happens when you reach page 64:

POKE 1524,81

The resulting blot was once white, is now cursor coloured.

The dwindling boom is familiar news to SF fans. Decades ago, a dreadful outfit called Badger Books found any SF would sell, and published 159 hackworks by a single author (R.L. Fanthorpe) who wrote one each weekend. It would be libellous to identify the Fanthorpes of computer publishing — but just as Badger poisoned the 1960s SF market, the exploiters have made home-micro books a bit of a joke.

And next, for the dim...

ONE OF THE main uses of a micro, or any other type of computer, is the manipulation of large volumes of data, as a single mass, or split up by any given criteria. In Basic, there are several simple commands which are at the heart of any data handler — arguably the most useful are Dimension, For, and Next.

Dim allows a user to set up an *array* of similar variables, so that, instead of using, say, A to Z for the first 26 variables entered, e.g.:

```
 10 INPUT A
 20 INPUT B ...
260 INPUT Z
```

it is possible to have each variable as a different point on the "number line" of the *one-dimensional array,* A:

```
 10 DIM A (26)
 20 INPUT A (1) ...
270 INPUT A (26)
```

(continued on next page)

(continued from previous page)

Line 10 sets up the array of variables, and from there onwards, they may be treated as independent variables. The advantage of this system only really comes to light when the array is used in conjunction with a *loop*. A simple loop can be set up using Goto, with a counter and decision to get out of it at the right time. This principle is used in the program below, which does just the same as the previous one, but in 22 less lines:

```
10 LET COUNT = 0
20 DIM A (26)
30 LET COUNT = F COUNT + 1
40 INPUT A (COUNT)
50 IF COUNT < 26 THEN
   GOTO 30
60 . . .
```

Using a For . . . Next loop, the program can be simplified still further:

```
10 DIM A (26)
20 FOR C = 1 TO 26
30 INPUT A (C)
40 NEXT C
```

The two programs function identically, but with the second version, the programmer does not have to bother keeping count himself; nor does he have to remember which line the original For command is on: the computer works out where to go to itself.

The same principle can be used for strings of letters, but, on the Spectrum, the length of the string must be defined, as though, on another computer, a two-dimensional array was being created:

```
10 DIM A$ (20,10)
```

will, on the Spectrum, create an array of 20 words, each 10 letters long. This is, in effect, the same as creating a two-dimensional array of characters, and, due to the string splicing commands, can be treated exactly as that. In most Basics, A$(20) is all that is required for a string array, and the variables can be of any length. Although the Spectrum's approach is more logical, and requires less memory, the latter system is more suited to data comparison and retrieval.

Once an array is set up, the component variables may be manipulated in the same way as any variable, but they may also be treated as a group, e.g.:

```
10 FOR X = 1 TO 26
20 LET A(X) = A(X) + 1
30 NEXT X
```

will add one onto each number in the array A. Using Step, every second value, for example:

```
10 FOR X = 1 TO 26 STEP 2
20 LET A(X) = A(X) + 1
30 NEXT X
```

. . . or only the second 13:

```
10 FOR X = 14 TO 26
20 LET A(X) = A(X) + 1
30 NEXT X
```

So far, arrays of only one "dimension" have been looked at; but any number of dimensions is possible: Dim A (10,10) creates a 2-D array of 10 numbers by 10 numbers (100 in all), and Dim A (10,10,10) will create a 3-D array. In practice, most programs seldom use more than two dimensions, so, to turn back to the 10 by 10 array:

Each of the primary "columns" has another 10 sub-rows: there are numbers ranging from A(1,1) through A(1,2) . . . A(1,10) . . . A(2,1) . . . A(10,10). This capability is important when *sets* of data must be processed: e.g. when programming a "Monopoly" card. The dimensions needed for "Rent — six values for each card, of which there are 22 — would be R(22,6).

Every card is referred to by a number (1 to 22), and each house state by a number from one to six, where one is "site only", two is "with one house", etc. up to six, which is "Hotel". The rent, then, for three houses, on property 18 is in R(18,4). The names of the properties could be stored in a string array, e.g. P$(22), so P$(1) would be "Old Kent Road".

In practice, it would be extremely tedious to enter all these values each time a game was to commence, or to write a program where the data are given on a one-to-one basis with their variable's name, and to alleviate this chore, there exists the Data command set to do this automatically.

After the command Data in a program, there exists a storage place for numbers or strings, e.g.

```
10 DATA "Old Kent Road",2,10,
   30,90,160,250,"Whitechapel
   Road",4,20,60,180,320,450
   (etc)
```

The program below reads this data line in the same basic way as the previous programs inputted data, but as there are two dimensions, it uses a "nest" of two loops, X and Y.

```
10 DATA (as above)
20 DIM R(22,6): DIM P$ (22)
   (P$ (22,20) on the Spectrum)
30 RESTORE
40 FOR X = 1 TO 22
50 READ P$(X)
60 FOR Y = 1 TO 6
70 READ R(X,Y)
80 NEXT Y: NEXT X
```

Restore resets the Data market so that data is read from the beginning of the line onwards. Read reads the data into the specified variable, and moves the market on one "data element", so that the next item is read next time. Note that, as there is only one string element to be read for each property, the Read P$(X) command is outside the inner nested loop.

BEGINNERS first bytes

How to come forth

FORTH IS very different from Basic and, indeed, most other high-level languages. It was originally developed by Charles Moore to control radio telescopes at the Kit Peak National Observatory, Arizona, in the early 1970s.

Described as a "high-level" language, Forth is effectively an extensible "macro language". It comes with a standard dictionary of words — i.e. macro definitions — which can be used and expanded to create the user's program. Each new word can be made up of those already in the dictionary or with assembly language mnemonics.

A macro definition is a collection of similar, or lower, level commands which make up a higher level function. This creates a language on a higher level than machine code but with very nearly the same execution speed.

Since each word can be used in successive words the user ends up with a program which is executed by typing one single word. The outcome of all this is that the user creates virtually a new language based around the original dictionary, so you can tailor the language to meet your requirements.

What really makes Forth a high-level language is that fully structured programming methods are employed as a fundamental feature. This is done through the use of control structures such as If . . . Else . . . Endif and Begin . . . While . . . Repeat. They give it many advantages over Basic such as the ability to support recursive structures.

Another major difference between Forth and Basic is the way in which the former evaluates arithmetic expressions.

Forth employs the use of a stack on which data are held and operated on. All access is to the top of the stack. Therefore, the last number on is the first off.

Operations upon the data use a convention called Reverse Polish Notation (RPN). As an example: 1 2 + 3 x is the RPN equivalent of (1 + 2)x3. As can be seen the operators are input after the data upon which they operate.

The 1 and 2 go on to the stack where they are added together. The result is placed at the top and the 3 is placed on the stack and then multiplied by the previous result. The final result is again left at the top of the stack.

Unlike nearly all implementations of Basic, standard Forths use integer arithmetic for their operations. In most cases they can handle up to 32-bit precisions if required. Floating-point routines can be incorporated but these would result in a reduction in execution speed.

Debugging a Forth program can be a real headache. This is mainly because of the way in which a Forth program is built up.

TOP★TIPS

SMOOTH MESSAGE

This program allows you to add the final touch to that game you have just finished writing, or it could be used to customise any other programs you have. The message is Poked into memory at location 32122 onwards, along with the required length and colour. When the routine is executed, the message is scrolled slowly and smoothly — not a trace of flicker — across the whole 32 colomns of the screen using the extreme bottom of the screen.

DOUBLE HEIGHT

This program for the Amstrad is designed to let you use double height characters in all modes. Simply type out the demonstration program and Run it and it will save the code for you. When you wish to re-use it you must load the code and type CALL&AAE0 (Enter) to set up the RSX. You can then use it like this:

```
10 a$="Hellow World"
20 locate 4,4:pen 2
30 a$"+a$
40 1double,§a$
```

Paul Mason

```
10 MEMORY &AAFF

RESPONSE *Frame*

Do you have a problem related to your micro? Our panel will do their best to help. Please include only one question per letter and mark it "Response Frame". Alternatively, perhaps you have an idea you'd like to pass on to others. Why not write to us with your top tips?

FASTER SAVE

■ Having seen many games over the past year with Hyperloads and a few games that have no Border, I have tried to write my own, also allowing me to disable Break completely by stopping the keyboard scan. The problem that I have come up against is that having found the Rom routine, how do I successfully transfer the routine to Ram so as it can be fiddled with? I think I know how to stop the border but I can't make it save faster.

Andrew Shoren,
West Drayton,
Middlesex.

FIRST OF all the thing that you must understand is that there are relative and absolute jumps in the routine (relative means jump backwards or forwards by X bytes. Absolute jump means jump to a given address). Get yourself a good assembler/disassembler and a copy of *The Complete Rom Disassembly* by Dr Ian Logan. As you will see, the routine to save is at 1218D/04CZH and is approximately 148 bytes long. As you will know, every time the routine is executed (by leaving an "edge" on the tape) the Border changes colour by way of the Out instruction. All that you do is NOP them out or if using an assembler leave them out altogether. Define the Border colour from Basic and jump into the routine and you're away.

To hypersave is a more difficult job. The highest speed I have ever attempted to use was in approx 1/7th of the normal time. Unfortunately the computer then wouldn't listen to it when I tried to load it back.

What happens is that the program waits for a set period of time before it either sends or listens for another pulse. If you decrease this length of time you will save far quicker. The delay is stored in the B register at 051FH (normal value 62D) and must be decreased (to about 45150).

To sum it up you can either copy the routine into Ram via a For-Next loop and search out all the absolute jumps (code 195) and replace the addresses with + however many bytes further up in the memory you put it. Otherwise use an assembler and copy the mnemonics from Dr Logan's book.

Craig Rawston.

PSEUDO BLEEP

■ Could you briefly explain how I could simulate the Beep function in machine language, also how do some programs manage to make the music play far louder than normal?

Michelle Pendleton,
Shepperton,
Surrey

FIRST, TO simulate the Sinclair Beep you need to use the following routine:

```
LD HL,Pitch
LD DE,Duration/Frequency
CALL 03B5H (Beep routine in Rom)
Ret
```

To work out the duration just multiply the time you want the noise to last by the frequency in HZ. Now if you want to make the sound louder, what you have to do is write a twin or three channel sound routine.

Try the following little ditty that I've concocted:

```
LD A, (5C48H)
RRA
RRA
RRA
LD B,Duration
LOOP LD C,254
DEC H
JR NZ, LOOP
XOR 16
OUT (C),A
LD H, FREQ 1
DEC L
JR NZ, LOOP
XOR 16
OUT (C),A
LD L,FREQ Z
DJNZ LOOP
RET
```

Place this routine at around 60000 in the memory and use the following:

```
10 REM TWIN-SOUND DEMO
20 REM c 1985 THE SHIRE
30 CLEAR 59999: LOAD "" CODE
40 FOR N = 0 TO 5
50 READ DUR:READ FREQA:
   READ FREQB
60 POKE 60007, DUR
65 POKE 60018, FREQA
70 POKE 60027, FREQB
80 RANDOMIZE USR 60000
90 NEXT N
100 DATA 200,205,206
110 DATA 70,230,231
120 DATA 255,254,255
130 DATA 255,205,206
140 DATA 255,170,171
150 DATA 255,125,126
```

You will notice that if FREQB is only one higher or lower than FREQA then the noise (sorry! note) caused will seem louder than the average Beep! If you were to write a three-channel routine, which is infinitely harder because registers only come in pairs, you would find the volume even higher.

Craig Rawston.

STORING M/C

■ I am planning to write a game in Basic with machine-code routines. What I would like to know is, where can I store the machine-code routines?

ALTHOUGH BBC Basic is very fast, one way of giving that extra "gloss" to games is to use machine-code routines for the most time critical points. Because of the small memory capacity, it is very important to choose the area of memory for the code carefully.

There are several ways to reserve memory for code but the most obvious way is to use the Dim statement. For example:

```
DIM code 100
```

would reserve 100 bytes, the start address being assigned to variable 'code'. Another technique is to store the code between video ram and the basic program. To do this, the size of the object code must first be estimated, say &100 bytes. Then the value of Himem must be lowered by that amount, ie:

```
HIMEM = HIMEM – &100
```

Now the machine code can be assembled from Mimem (the new value) onwards.

For small machine-code routines, it might be convenient to place them in parts of memory below Basic. The choice depends on your Basic program but here are a few guidelines.

9OO-9FF A safe area so long as you are not using the commands Opening and Openout on tape.

AOO-AFF This part of memory is normally used as cassette workspace and may be used on disc based machines.

BOO-BFF Function key definitions. Use this area of memory if function keys are not being used.

COO-CFF User defined character definitions. This part of memory may be used if user defined characters are not being used.

DOO-DFF User defined character definitions. This part of memory may be used if user defined characters are not being used.

DOO-DFF Used by NMI routines. Usually safe for tape based machines.

Patch On

M K Mostowyj,
Peterborough.

Amstrad

ANYONE WHO owns a DMP1 Printer should already know that the character matrix used is only 5 by 7. Whilst the printout is reasonably good, it could be improved by using a larger character matrix. This program does just that. It works by inserting a patch in the appropriate jump block to redirect the printer routine to a new one in memory.

The new routine provides the DMP1 with a matrix of 8 by 7 with a maximum width of 60 characters in normal mode and 30 characters when printing double width. Although the width is reduced the clarity is increased considerably, and this ability to redefine the complete printer character set is included. Also the # and £ symbols can be mied without the need to alter the Dip switches on the printer.

When the routine is in memory and has been called two RSX commands are logged on. These are:

:PATCHON to turn on the routine
:PATCHOFF to turn it off

All RSX commands must be preceeded with the : symbol. Shifted @?;

First of all type in listing one, and save it before running in case of any errors you may make. When this is run, if all is well, you will be given the opportunity to save the resultant code to tape.

SOFTWARE File

Programs for Software File should be fairly compact and sent on a cassette. Please include clear instructions and say what computer it's for. We pay between £6 and £36 for programs published. They must be double-checked and submitted

Once this is done you can reload it any time with:
MEMORY 41659:LOAD"PATCH":CALL 41660

This can either be a direct command or a line within your basic program.

Now enter listing two and save it on a separate tape. When this program is run you will be asked for the name of the character set you wish to load. The original is saved as patch. Once you have loaded the set various options are open to you.

Menu 1.

N — New Character. If pressed the prompt enter character is issued. Enter any Character from the keyboard and press enter. Menu 2 is Then displayed.

S — Save driver and code. Saves Character set and driver complete with any Alterations you may have made. A Library of different set can be compiled.

Menu 2.

ARROWS — Moves cursor around grid.
COPY — Sets/resets bit Occupied by curso.
ENTER — Large enter key stores character as defined in grid.
C — Clear grid.
I — Inverse character.
Q — Quits character Without Storing it and returns to menu 1.

Rotate 'N' Roll

Dave Millen
Welwyn Garden City,
Hertfordshire.

Spectrum

ROTATE 'N' ROLL is an intriguing program for any Spectrum written in Basic, which enables the operator to produce three-dimensional wire frame images of prisms or polyhedrons. The number of sides is optional as is the size of the drawing. The shapes can be shown as a series of single frame movements or can be superimposed to create patterns. Apart from the fascination of the patterns produced, the program can be a valuable aid to secondary school teachers of technical graphics to help pupils to visualise objects in movement.

The rotate facility turns clockwise around a vertical axis and the roll turns the object clockwise around a horizontal axis. The size increase give the impression of movement towards the viewer. A combination of superimposed images using all three facilities simulates a solid moving in space, showing the loci of the sides for specified movements.

The program can be paused at any stage of drawing by holding down M. To continue or abort the drawing, follow the instructions on the screen.

Watching the Demo mode will give the operator an idea of what can be achieved. In Run mode the operator is required to program in his/her instructions. Here is a brief explanation of each input in turn. Each input must be terminated with Enter. Mistakes can be rectified by pressing Caps Shift and Delete.

Polyhedrom — a 3D shape with a flat base, number of sides optional, and lines from each corner joining in a point. Example: pyramid.

Prism — a 3D shape with a flat base and top, number of sides optional. Lines from each corner join the base and top. Example: Cube.

Enter number of sides — This is self-explanatory.

Enter Size-(0-140) — Each unit represents one pixel on the vertical axis at 0 rotation and roll. 140 units is the maximum size, otherwise the program will stop drawing with the message "figures too big" when the roll approaches 45.

Enter initial rotation — To establish the starting position of the object in degrees. 0 degrees rotation gives a side view with a flat face towards the viewer. 45 deg. rotation of a cube would give a corner towards the viewer.

Enter initial roll — Again establishing the starting position of the object in degrees. 0 degrees rotation gives a side view of the object with the face towards the viewer determined by the rotation. The top of the object rolls towards the viewer. 90 deg. roll will give a top view of the object.

Repeat (Y/N) — If the viewer wishes just a drawing of the object already entered then N should be entered. If a sequence of drawings is required then enter Y.

How many! — Number of drawings required in the sequence.

Enter size inc/dec — To increase or decrease the size of the object during a sequence. To avoid exceeding the maximum size the initial size should be subtracted from 140 and the result divided by the number of repeats previously entered.

When decreasing in size, enter a minus number in response to the prompt. If the size reaches 0 before and end of the sequence it will continue but start increasing in size.

Enter rotation increase — The number of degrees by which the object must rotate each time, in a sequence. 360 deg. gives a complete rotation and would give no change. A minus number causes the object to rotate anticlockwise.

Enter roll increase — The number of degrees by which the object must roll towards the viewer each time, in a sequence. 360 deg. gives a complete roll. A minus number causes the object to roll away from the viewer.

Superimpose? (Y/N) — If drawings are required as separate images one after another then enter N. To overlay each successive drawing onto the previous drawings, in the sequence, enter Y.

Enter paper colour — Use keys 0 to 7 to enter your desired paper colour.

Enter ink colour — Use keys 0 to 7 to enter your desired ink colour.

The program will now proceed to follow the instructions entered. Details of each drawing are printed on the left of the screen display. Rotate 'n' roll is very easy to use and provides endless fascination for young and old alike.

For those who do not like typing in listings, I can supply copies on cassette for £3, including postage and packing. Send a cheque or postal order to Dave Millen, 28, Well Garth, Welwyn Garden City, Herts, AL 3AX.

Short Circuit

David Green,
Ashford,
Kent.

ZX-81

BASED ON one of the more memorable scenes from the film whose title was apparently pronounced *Trarn*, this game is in fact a vastly improved version of the all-time classic in which a bunch of lines chase each other around for no very good reason. What makes this one different is that it uses a huge 10K playing area, of which only a small part can be seen through your constantly-scrolling window, allowing you to do battle against a maximum of nine computer-controlled pseudo-intelligent opponents. Given the limitations of the machine, it's a great game.

Typing the program in is not particularly difficult, just time-consuming and boring. I suggest you do it in the following stages.

1. Type in the Rem creator program in listing 1, and run it. Then edit line 1 as instructed, press Newline and then use the two commands POKE 16510,0 and POKE 16513,234 to make it into a REM statement that thinks that it is over 1870 bytes long. Check this as PEEK 18394 should be 28.

2. Do not get rid of line 1, and then type in the hexloader from listing 2. Use this to painstakingly thump in the machine code from listing 3.

3. Delete the hexloader, but not line 0, and type in the screen data loader in listing 4 and run this.

4. Type in the Basic program from listing 5 after the line O REM, which should still be there. Please remember to save this before running, but then you can enjoy the game.

I shouldn't need to explain the obvious tactical topology of the game, but if you get completely lost, your opponents always start in around the top-left corner of the arena. Something you may be unfamiliar with is the "short circuit" of the title, which means that when a tracer is destroyed, most of its trail conveniently disappears as well. If you'd like to change the level of difficulty, location 17068 holds the start speed — normally 10 — and location 17073 holds the starting number of opponents, up to a maximum of nine.

Finally, thanks to Stephen Blackford for his occasionally constructive criticism.

Listing 1. Rem creator.

Autodialer

John Derrick,
Cheddar,
Somerset.

CBM-64

I HAVE been using your Telsoft service. I wrote this to take advantage of the auto-dial facility..

The program D3 is entirely machine code and is designed to work with D1 and D2 of the Dialsoft program. To use it load the three programs and type

SYS 49188

and press Return. The program prompts for the number to dial. Type the number, with a minus sign separator if necessary, pressing Delete if you make a mistake. Pressing Return or typing 5 digits, causes the number to be dialed. D3 now passes control to D1 and the program proceeds as normal. The program on tape is a Basic loader for the machine code, so the saver with the dialsoft program used to save D1 and D2 can be used to save D3 to tape or disc.

The D3 program isn't relocatable unless it is re-written, i.e. change the JSR's and some LDA's, but it doesn't matter if the program is overwritten once you are on-line, as it won't be reused.

Screen Handler

Steven Meyfroide,
Middleton,
Manchester.

Enterprise

AS YOU will probably have discovered, the screen handling on the Enterprise is very flexible. Like the Atari, previously unequalled for graphics, it has a total of 256 colours, and also like the Atari, different screen modes can be displayed at the same time. For example, say you want a 16 colour hi-res screen for graphics and a small text screen above it for score etc, then just open the appropriate channels and display them wherever you want them:

```
100 set video mode 1 !Hi-res graphics
110 set video colur 2 !16 colours; horizontal res
160
120 set video × 40 !40 chars across
130 set video y 20 !20 chars down
140 open£1: "video:" !Open the hires page
150 set video mode 0 !40 column text
160 set video colour 0 !Two colours
170 set video y 4 !4 chars down
180 open£3:"video:" !Open the text page
```

At this stage the pages are not on the screen, so display them

```
190 display£1:at 5 from 1 to 20 !16 colour lines
from 5-25
200 display£2:at 1 from 1 to 4 !Text from 1-4
```

Note that the settings for 'videox' etc are not

(continued on next page)

(continued from previous page)

erased by an open, ie they don't have to be defined for every channel if the channels have the same settings for any of them. Hence, in the program above, "video × " is defined once and this setting is used for both pages.

At the top of Ram is a block of memory that the video chip uses to display a screen. this is like a program, telling the chip what mode the next line is to be in etc, but more importantly, it holds a palette for every single line it has to display. If we could change this, we could change the palette for a given line within the same channel ie, Colour 1 could be red on the first line of channel 1, in which case anything drawn in colour one appears as red; and also, colour 1 could be blue on the next line.

The only problem is how to access this block of memory, but luckily, it is quite easy with the Speek and Spoke commands in IS Basic. Firstly, you need to know where the Line Parameter Block is so:

A=SPEEK(255,49140)+SPEEK(255,49141)*256).

An address will be put into A that is the beginning of the block of memory we want. A will usually be equal to 47872 in Basic. The format of this table is:

Disp Contents
00 Two's complement of scanlines in this modeline.
01 The video display mode for this line
02 See Technical manual
03 See Technical manual.
04 Lo byte of address of screen memory for this modeline.
05 Hi byte of address of screen memory for this modeline.
06 Lo of graphic memory in attribute mode or address of character definitions in text modes.
07 Hi of above.
08-15 Palette definition. (Colours 0-7)

The address of the screen memory (04-05) can be used to Poke the display in Basic or machine code — the format of the screen memory for the various modes is detailed in the Technical Manual. Moreover, the data we want is there at 08-15. All that is needed is a small program to change the palette definition to what we want - here is a simple one. Put the colours wanted for colours 0-7 in the Data statement and run it.

```
5 LET num =5
10 FOR A=47872 TO 47872 + num*16-6 STEP 16
20 FOR B=08 TO 15
30 READ C
40 SPOKE 255,A+B,C
50 NEXT B
60 NEXT A
70 END
100 DATA 15,25,35,45,55,65,75,85,
110 DATA 95,105,115,125,135,145,155,165
120 DATA 175,185,195,205,215,225,235,245
130 DATA 49,59,69,79,89,99,109,119
140 DATA 58,46,112,195,237,247,168,249
```

...etc for number of lines wanting to be changed...Just set 'num' to however many lines you want changing. Notice that the first line is the Status Line, and to miss this out change line 10 to:

```
10 FOR A=47872+16 TO 47872+16+...etc..
```

With the knowledge of what is in the Line Parameter Block, I'm sure you can think of many interesting things to do — scrolling is easy, for example: just change the address of the screen memory on every line to equal the address of the line above or below it. Sideways scrolling can also be done but with a bit more difficulty.

One interesting project would be to install a new device driver so that a channel could be opened that simulated say a Spectrum screen (attribute mode is the obvious choice!) or BBC screen(s). The driver would have to be able to interpret control codes sent to it and act on them as the BBC or Spectrum would do.

This wouldn't be too difficult with a knowledge of machine code since the way to install device drivers is outlined in the Technical manual. If a BBC screen was simulated like this (but beware of the different modes, especially teletext — ignore colour control codes), then coversion from BBC Basic to IS Basic would be simple — procedures and functions are defined in similar ways (though the IS versions are more powerful with parameter passing by reference — including other functions and arrays).

You have probably noticed that you can't use FOR...NEXT loops in immediate mode! This can be very useful while editing to test the contents of memory, so to do this, type EDIT 200 to create a work space for program 200 (!) and type your For loop in as a separate program, eg:

```
EDIT 200
10 FOR A=1 TO 10
20 PRINT PEEK (A);
30 NEXT A
```

This can be run and then Newed. Type EDIT 0 or whatever to get to your real problem.

Turboload

R Grzasko,
London SE15.

Vic 20

THIS UTILITY program will load, save and verify programs six times faster than normal.

First of all type in program one save it then run it. This will move the start of basic above the part of Ram where the Turboload program is located.

Save in case of error

Next type in program two and save it in case of an error. Then run the program.

If all is well after a short time a message will appear on the screen — "You are now ready to Turboload programs". Type:

SYS5120

to activate the Turboload program. The Turboload program will not load programs that have not been saved by the Turboload program, also normal programs will not load with the Turboloader activated.

Press Run Stop and Restore

To overcome this problem press run stop and restore together. You can now load normal programs. Then you can type:

SYS5120

and save your program at turbo speeds.

When programs using the Turboloader are loading the border will turn blue. A more colourful display may be obtained by changing line 2000 to:

2000 DATA90,29,FC,EA,EA,49,04,8D,1123

If you experience load, verify and save problems try using a good quality computer tape.

Headerless files

Ian Harris,
Old Windsor,
Berkshire.

Spectrum

WHEN YOU USE the ordinary Spectrum Save and Load commands, the computer normally deals with the tape file in two parts. The first is the header which contains information about the start address and the length and name of the file. The secod is the actual block of code to be saved/loaded.

This short machine code program enables the user to bypass the header, and save or load the block of code on its own. This is achieved by typing in one of the two new commands, the format of which is as follows.

To save a headerless file, type:

*SAVE start, length

To load a headerless file, type:

*LOAD start, length

where "start" is the address at which the file is to begin, e.g.: 16384 — the start of the screen — and "length" is the number of bytes that are to be saved/loaded, e.g.: 6912 — the length of a Screen.

Note that the program will not load the actual header of a file; only the code block after it. You can also load a specified amount of a file, e.g.: the first third of a screen picture. To do this, take any screen picture file, and type:

*LOAD 16384, 2048

16384 is the start of the screen; 2048 is the number of bytes in the first third of the screen. The program will stop loading part way through the tape file, i.e., when 2048 bytes have been loaded.

If you don't know the length of a headerless file, just set the length equal to 65535; this will load in everything, no matter what length.

To get the routine up and running, type in listing 1. Save this on a blank tape using:

SAVE "HEADERLESS"LINE 1

Now type New and enter listing 2. Run it, and when there are no errors save the machine code after the loader with:

SAVE "H" CODE 65162,206

The checksum in the listing should detect most errors. Now reset your machine, and Load the whole thing ing. To initialise the routine, type:

RANDOMIZE USR 65356

*Save and *Load should now be accepted. If they are not, or the routine crashes, then there is an error in the machine code.

If for any reason the Spectrum fails to accept the commands but you know that they work correctly; this is probably due to a Clear command or Run command being executed; then just reinitialise the routine using the USR statement as above.

If you wish to use the commands in a program, make sure that:

RANDOMIZE USR 65356

is the first line of your routine.

Loader program.

```
   1 CLEAR 65161: LOAD "H"CODE 6
5162,206: PRINT "Type RANDOMIZE
USR 65356 to""initialise."
```

Hex loader.

```
  10 DEF FN h(h$)=16+(CODE h$(1)
-48-(7 AND h$(1)>"9"))+CODE h$(2
)-48-(7 AND h$(2)>"9")

Telecolour

J C Bullock,
Telford,
Shropshire.

BBC

TELECOLOUR MAKES it easier to produce the CHR$ colour commands, by printing the correct CHR$ expression when one of the function keys is pressed with Shift/CTRL for example:

When Telecolour is off, SHIFT + f1 produces a red colour control character.

When Telecolour is on, SHIFT + f1 produces 'CHR$129;'

The program occupies less than 255 bytes in machine code. Type it in, Run it, an type:

*SAVE TELECOL 900 9FF

If you press CTRL and Break or redefine f0 or the Break key, you will have to type in *FX18 followed by the 2 function key definitions given in lines 50 and 60 of the listing. Now, Break will switch Telecolour on, f0 will switch it off.

RESULTS

50 STICKS COMPETITION

HAVING RECEIVED hundreds of entries to the August competition we had a most interesting and often amusing read that took us well into the night.

Certainly, if a joystick could be implanted into one's brain, the majority of *Your Computer* readers would at last be happy. The most surprising thing was how few females entered the competition — come on now girls, you were only noted by your absence. We find it hard to believe that only a mere handful of females read *Your Computer*!

The eventual 50 winners of The Stick cover a noticeably wide age range and the elaborate imaginative illustrations of the younger entrants — about eight and nine year olds — foretell dynamic things for the future. Some harrassed fathers needed a joystick to control their wilder offspring, some entrants seem to be budding brain surgeons with implants threateningly popular, some were constructive well thought out joystick ideas and some were concerned with aiding the disabled.

The Stick, being extremely responsive and for single handed use, working on an eight point mercury switch, will — we know — fulfill all your joystick needs — until of course one of those eight year olds with aspirations to brain survery come of age. And then....?

Among the more off-beat suggestions were D. Bourn's thought-controlled food dispenser and A. Burns' speech activated joystick which moves objects faster when it detects stress in your voice. Best of all, perhaps, was H. McMillan's Jeeves Mk 1 Computer Control System — the accompanying cartoon shows Jeeves running for the keyboard while Bertie Wooster is shouting from the comfort of his armchair: "Dammit Jeeves, Fire!".

WINNERS

B. Mawson, Slough
K. Scott, Jedburgh
R. Scaife, Newcastle
D. Bourne, Wolverhampton
J. Powell, Telford
C. Noad, Yateley
R. P. Shaw, Nailsea
P. Jordan, Pontefract
H. Reeve, Wetherby

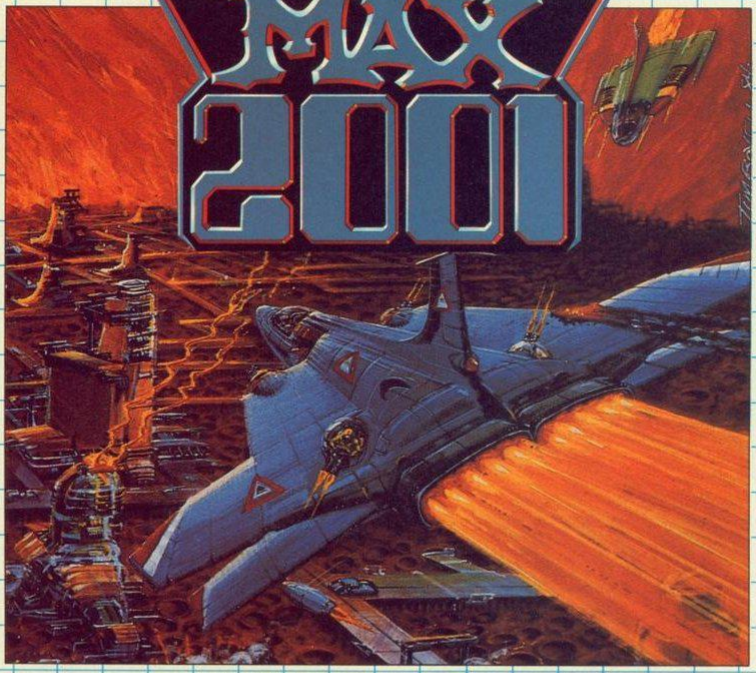
THE MAX CHATSWORTH LEGEND LIVES ON

INTO THE 21ST CENTURY....



CASSETTE £9.95

DISK £14.95

You are Max Chatsworth IX, a direct descendant of Max Chatsworth of BLUE MAX fame. You have lived and breathed his legend, and now fate calls upon you to fight an evil so foul that he could not even have imagined it.
The FURXX empire has extended its iron hand to Earthbase Gamma IV, and captured it. The inhabitants who were not killed in that struggle, were enslaved and sent to FURXX conversion processors to be drained of their life force, so that the FURXX TimeMasters could extend their own lifespans. Having effected an easy victory, the FURXX now intend to invade all earth colonies and finally capture the earth herself.
Your mission is to penetrate enemy defences, destroy their hoverfields, and finally destroy the symbol upon which the FURXX EMPIRE IS BUILT. And this must be accomplished IMMEDIATELY, for the fate of the world rests in your hand!

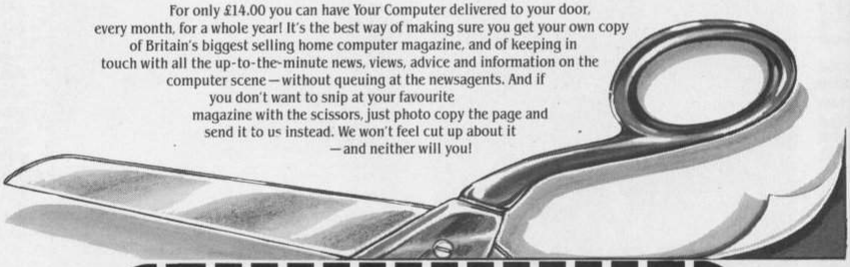
It's a snip.

For only £14.00 you can have Your Computer delivered to your door, every month, for a whole year! It's the best way of making sure you get your own copy of Britain's biggest selling home computer magazine, and of keeping in touch with all the up-to-the-minute news, views, advice and information on the computer scene — without queuing at the newsagents. And if you don't want to snip at your favourite magazine with the scissors, just photo copy the page and send it to us instead. We won't feel cut up about it — and neither will you!



YOUR COMPUTER

PUT YOUR MICRO ON THE PHONE

The new GEC Datachat 1223 modem gets you and your micro into the data communications age in the simplest and safest way possible. With its novel feature of being powered from the telephone line, Datachat requires no mains supply or batteries.

Datachat gives you access to a huge amount of information held on data bases such as Prestel and Micronet 800 and lets you communicate through electronic mail systems like Telecom Gold.

Datachat offers both 1200/75 and 75/1200bit/s operation to CCITT V23 standard. Using this high-speed turn-round capability means that you can chat and swap programs with other micro users at 1200bit/s.

And if you have a BBC Model B then GEC can supply advanced communications software on disc or ROM. The software includes an exciting user-to-user communication capability that is menu driven and really user friendly. Operation of the modem is also possible with many other communications software packages, microcomputers and terminals.

One of a range of professional modems designed and manufactured in the United Kingdom by GEC Telecommunications Limited, Datachat is fully approved by the British Approvals Board for Telecommunications (BABT) and is ideal for business, educational and home users.

Modem Division Sales
Transmission Group, GEC Telecommunications Limited, PO Box 53, Coventry, CV3 1HJ.

COMPUTER SOFTWARE

DISCOVERY

THE NEW DISC DRIVE SENSATION

At last Spectrum owners can choose a TRUE disc drive system for their computer, backed by REAL software support and available with the most comprehensive specification yet developed.

For just £199.95 Discovery offers a new level of performance and a combination of advanced features which make other fast storage systems for the Spectrum and Spectrum + look obsolete.

No wonder one leading computer magazine, Sinclair User, recommended Discovery in its latest guide to fast storage systems for the Spectrum.

Discovery has been designed to take no USER RAM from the Spectrum during the use of tape-based programs, it accepts the same commands as 'Interface I' allowing you to use many of the cassette programs designed for microdrive and we've even provided you with the firmware to use a super fast RAM DISC when you choose. Random Access Files are fully supported and formatting and back-up routines are included in ROM.

Add to all this a range of great software titles on the latest 3½" disc cartridges commissioned by Boots and you begin to see why we named it Discovery. Leading titles from Hewson Consultants, Micromega, Activision, Melbourne House, Database, Romantic Robot, Betasoft, Tasman and O.C.P.

Discovery is available from larger branches of Boots and selected computer stores nationwide. For further details call us on 0737 65080 or post the coupon now.

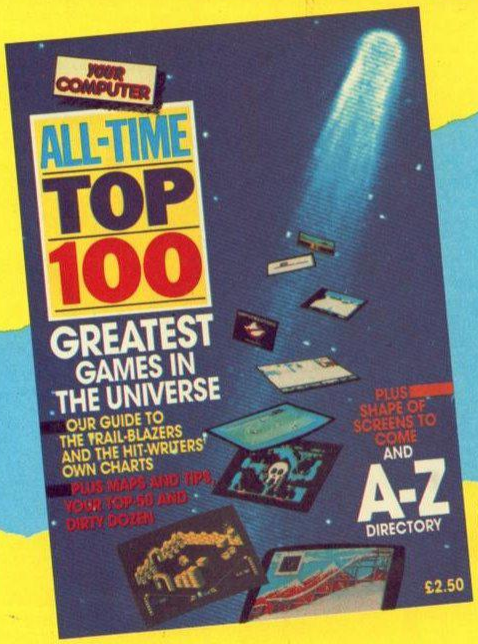
Different credit terms apply at these branches. Please ask for written details.

Keep it close to your joystick this winter.



ON SALE 13th NOVEMBER

Joysticks and keyboards love a challenge on long cold nights, and that's when this book will come in very handy. It's written by the same people who've made Your Computer the country's most popular home computer magazine and it's packed with programs and games that will test even the toughest joystick or keyboard.

The 'All Time Top 100 Games' is a comprehensive reference guide to the most popular commercial software ever released for all the best selling machines. As well as the Top 100 Games, this definitive guide for games players has tips on adventure playing, an A-Z directory of hundreds of games not in the top 100 and the top 20 choices of the professional authors themselves. Plus a reader top 50, games maps, features on flight simulators and telegaming, and the worst games ever.

It's on sale from 13th November in all good booksellers. Or you can order your copy direct from us by completing the coupon below or calling in at our trade counter, 5 Sumner Street, London SE1.

Please send me_____copy/ies of the 'All Time Top 100 Games' at £2.70 each inc. p&p.

SUSS BOX

£49.95 +VAT
incl. carriage
CWO please
pocket size

The DUPLEX SUSS-BOX has been designed to enable the less skilled computer user to have a better understanding of the correctly working connection between a computer and a peripherale, such as a printer. This is achieved by using the commonly used signals (wires) of the RS232C serial data cable specification, a matrix-block and special connector pins. by inserting the connector pins into the SUSS-BOX's matrix-block at the exits of two incoming signals the user can quickly establish a firm connection. The signals are routed into the SUSS-BOX by two 25 way D type connectors; 1xfemale, 1xmale. The SUSS-BOX also provides a lamp for each signal to show iuts condition when connected in line, ie high or low. SUSS-ADAPTOR & CABLES available.

JUPITER ACE owners! Adventure/arcade games, utilities (assembler etc). Two programs per tape only £3! S.A.E. for list. S. Leask, Robinson College, Cambridge, England CB3 9AN. 777

WDSoftware

FOR THE QL

Utilities (3rd ed) (base £5.50)
PRINT 60-file DIRectory or view it on one screen, one-key LOAD, COPY or PRINT 60 files with one key (allows for namesakes). Multiple FORMATting to prevent corrupting by stretching of tape. TOOLkit to give dated, numbered modules in program development. PRUNE old files to release space (one key DELETEs a file). Full instructions in QUILL file. Use up to 6 EXTRA MICRODRIVES (add on your Spectrum ones)!

WD Utilities for CST Q-Discs (2nd ed) (base £8)
As above, with extra utilities; 100-file capacity, for CST/Computamate disc systems AND up to four extra microdrives. User-friendly timesavers. Update 1st ed for 25p (£1.25 outside Europe).

Ref QL (5th ed) (base £5)
900 useful QL references in an ARCHIVE file (too long to share cartridge with other software). Also ARCHIVE 2 search program.

FOR SPECTRUM/QL/BBC/ELECTRON

WD Morse Tutor (base £4)
From absolute beginner to beyond RYA and Amateur Radio receiving. Adjust pitch. Set speed to your test level (4-18 wpm). Learn from single characters, via groups with wide spaces to random sentences; decrease spacing to normal. Write down what you hear, then CHECK on Screen or Printer (or speech for Spectrum with Currah Microspeech). Also own message, random figures, letters or mixed.

FOR SPECTRUM 48K

WordWinder (microdrive/disc only) (basic £8)
For CHEATING at crosswords. Finds m-ss-g letters, solves anagrams of shingle words. 13,000 word vocabulary. 10-letter word ending in ATE? No problem!

Tradewind (base £4)
Sailing/trading strategy game with graphic surprises.

Jersey Quest (base £4)
Text adventure with Bergerac and the Dragon. Based on genuine folklore of the Island or Jersey. (Not on SPOOS)

PRICES (incl. Europe postage — elsewhere add £1).
Cassettes — base price only. QL or Spectrum Microdrives — £2/cartridge plus base price; 3¼" floppies £2, 3½" floppies £4 plus base (SPOOS/MetaDOS disks for Spectrum). State required format when ordering. ACCESS/Mastercard welcome (over £6).

Two or more programs on one medium — pay medium + base, e.g. WD Utilities and Morse on microdrive for £11.50, but IMPOSSIBLE to mix QL/BBC/Spectrum programs on one medium. Send YOUR cartridge and base price, but FORMAT it FIRST six times like us for reliability.

DATEBASE

Compec

This show is limited to professional users, big boys like Olivetti, IBM, Hewlett-Packard and so on. Open every day from 10 till 6 at Olympia. Organised by Reed Exhibitions, Surrey House, 1 Throwley Way, Sutton, Surrey, SM1 4QQ. Telephone 01-643 8040.

Electron and BBC Micro User Show

From November 14 to 17 at the New Horticultural Hall in London. Open to the general public from 10 till 6 every day. Organised by Database Publications, Europa House, Chester Road, Stockport, Cheshire. Telephone 061 456 8383.

Dragon & Tandy 6809 Colour Show

These mythical beasts ride back into town with forty exhibitors in tow and can be inspected at the Royal Horticultural Halls in London on November 23 and 24. It's £3 and £2 to get in, or £2 and £1 if you apply by post to Editionscheme Ltd, HR House, 447 High Road, Finchley, London N1. Telephone 01-346 6566.

Ever wondered who were the audience guinea-pigs for each new season of television programmes? Well, now you know. They don't like "V" very much for obvious reasons, but get all their fashion hints from that stylish American cop series "Miami Mice".

Trivia

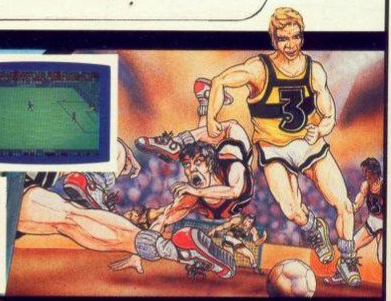
A family game for 2 to 4 players in which mum is just as much at home as the sports crazy son.
Over 2000 questions on six subjects like Entertainment - Sports - History.

C64 - Amstrad - Atari - BBC - Spectrum £7.95

FIVE-A-SIDE

A soccer game with real pace in which passing skills are as essential as speed. Penalty shoot out truly tests your anticipation.
One or two player option.

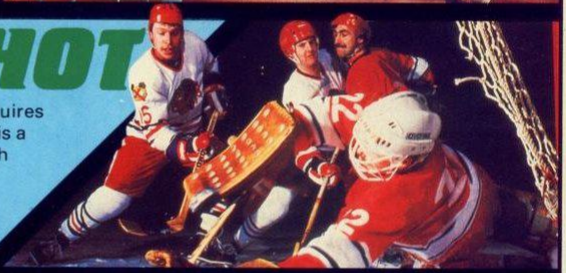
C64 - £5.95
Spectrum - Amstrad
Atari - BBC - MSX SOON



SLAP SHOT

A fast and furious game which requires skill and fast reactions. Ice Hockey is a tough game but persistent rough game is punished by roughing penalties.
One player or two player option.

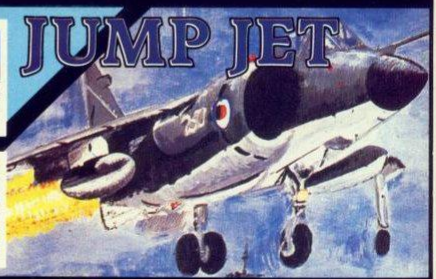
C64 - Amstrad - MSX £8.95



JUMP JET

Assume control of this unique fighting machine. Take care that you practice take off and landing thoroughly before you embark on a combat mission to seek and destroy the enemy aircrafts. Use your radar to locate the carrier and land in worsening weather conditions as you progress through the ranks.

C64 - Amstrad - BBC £9.95.
Atari - Spect - Electron SOON



VOICE MASTER

VOICE MASTER A unique three in one package.
Speech Reproduction - Speaks in your own voice. Easy to incorporate speech in your own programmes. Recorded speech does not require Voice Master for reproduction.
Speech Recognition - Imagine your computer actually understanding what you say.
Voice Harp - Just whistle or hum to produce music
